Le package rawfonts

Alan Jeffrey * v0.01

Généralités

Le package LATEX 2ε rawfonts est utilisé pour fournir une émulation de documents LATEX 2.09 qui utilisaient des commandes de bas niveau telles que \tenrm. Si vous dites :

\usepackage{rawfonts}

alors plus de soixante fontes telles que **\tenrm** seront chargées dans LATEX. Ceci est un surcoût considérable, par exemple ce document ¹ utilise

8221 mots d'informations de fonte pour 30 fontes

mais quand on le compile avec le package rawfonts, il utilise :

19294 mots d'informations de fonte pour 73 fontes

C'est pour quoi l'utilisation de <code>rawfonts</code> est un sur coût considérable, qui peut aller jusqu'à doubler le nombre de font es utilisées (Ce sur coût est la raison pour laquelle LATEX $2_{\mathcal{E}}$ ne définit pas \tenrm et ses analogues par défaut)

Si vous désirez ne charger qu'un petit nombre de fontes, vous pouvez utiliser l'option only, par exemple pour ne charger que \tensf :

\usepackage[only,tenrm,tensf]{rawfonts}

Le package rawfonts est destiné principalement à être utilisé avec des documents écrits pour IATEX 2.09, et vous pouvez désirer que ce package soit chargé chaque fois que vous utilisez IATEX $2_{\mathcal{E}}$ en mode compatibilité. Dans ce cas, vous devriez ajouter la ligne :

\RequirePackage{rawfonts}

dans votre fichier latex209.cfg de configuration de compatibilité LATEX 2.09.

^{*}Traduit par Jean-Pierre Drucbert le 3 Déc. 1999. Titre original : The rawfonts package 1. la version originale. NdT

Implémentation
