L'extension fileerr : gestion de l'erreur de fichier non trouvé *

Frank Mittelbach

28/12/2003

Ce fichier est maintenu par l'équipe du « LATEX Project ». Les rapports d'anomalie peuvent être envoyés en anglais à http://latex-project.org/bugs.html (catégorie tools).

1 Introduction

★When \LaTeX Z_{ε} is unable to find a file it will ask for an alternative file name. However, sometimes the problem is only noticed by $T_{\varepsilon}X$, and in that case $T_{\varepsilon}X$ insists on getting a valid file name; any other attempt to leave this error loop will fail. Many users try to respond in the same way as to normal error messages, e.g. by typing $\langle return \rangle$, or s or x, but $T_{\varepsilon}X$ will interpret this as a file name and will ask again.

To provide a graceful exit out of this loop, we define a number of files which emulate the normal behavior of T_FX in the error loop as far as possible.

After installing these files the user can respond with h, q, r, s, e, x, and on some systems also with $\langle return \rangle$ to T_FX's missing file name question.

2 The documentation driver

This code will generate the documentation. Since it is the first piece of code in the file, the documentation can be obtained by simply processing this file with \LaTeX $\Sigma = \Sigma$.

- 1 (*driver)
- 2 \documentclass{ltxdoc}
- 3 \usepackage[utf8]{inputenc}
- 4 \usepackage[T1]{fontenc}
- 5 \usepackage[ltxdoc,babel]{translatex-fr}

^{*}Ce fichier a pour numéro de version v1.1a et a été mis à jour le 28/12/2003.

^{1.} On some systems, T_EX accepts a special character denoting the end of file to return from this loop, e.g. Control-D on UNIX or Control-Z on DOS.

```
6 \begin{document} \DocInput{fileerr-fr.dtx} \end{document} 7 \langle /driver \rangle
```

3 The files

3.1 Asking for help with h

When the user types h in the file error loop TEX will look for the file h.tex. In this file we put a message informing the user about the situation (we use ^^J to start new lines in the message) and then finish with a normal \errmessage command thereby bringing up TEX's normal error mechanism.

```
8 \langle *help\\
9 \newlinechar='\^^J
10 \message{! The file name provided could not be found.^^J\%
11 Use '\enter>' to continue processing,^^J\%
12 'S' to scroll future errors^^J\%
13 'R' to run without stopping,^^J\%
14 'Q' to run quietly,^^J\%
15 or 'X' to terminate TeX\}
16 \errmessage{\}
17 \langle /help\\end{array}
```

3.2 Scrolling this and further errors with s

For the response s we put a message into the file s.tex and start \scrollmode to scroll further error messages in this run. On systems that allow .tex as a file name we can also trap a single $\langle return \rangle$ from the user.

```
\begin{array}{lll} 18 & \langle +scroll \mid return \mid run, batch \rangle & \\ 19 & \langle +scroll \rangle & \\ 20 & \langle +run \rangle & \\ 10 & \langle +batch \rangle & \\ \end{array}
```

3.3 Exiting the run with x or e

If the user enters x or e to stop TEX, we need to put something into the corresponding file which will force TEX to give up. We achieve this by turning off terminal output and then asking TEX to stop: first by using the internal LATEX name \@Qend, and if that doesn't work because something other than LATEX is used, by trying the TEX primitive \end. The \errmessage is there to ensure that TEX's internal "history" variable is set to error_message_issued. This in turn will hopefully set the exit code on those operating systems that implement return codes (though there is no guarantee for this).

```
22 (+edit | exit) \batchmode \errmessage{}\csname @@end\endcsname \end
```

We end every file with an explicit \endinput which prevents the docstrip program from putting the character table into the generated files.

```
23 \endinput
```
