1 Historique

Cette extension a débuté sa vie comme une interface LETEX pour sélectionner les fontes présentes sur le système MacOSX dans XETEX de Jonathan Kew, la première variante largement utilisée de TEX gérant Unicode. Avec le temps, XETEX fut étendu pour supporter les fontes Opentype puis fut porté en un programme multiplate-forme pour pouvoir fonctionner avec windows et Linux.

Plus récemment, LuaTeX est rapidement devenu le moteur TeX du moment; il supporte les encodages Unicode, les fontes Opentype et ouvre les mécaniques internes de TeX par le biais du langage de programmation Lua. ConTeXt Mk. IV de Hans Hagen est une réécriture de son puissant système de composition, tirant pleinement parti des capacités de LuaTeX tel le support des fontes; une partie centrale de son travail en ce domaine a été extraite pour être utilisée pour d'autres systèmes de commandes TeX et ceci a permis à fontspec d'être adapté à LaTeX lorsqu'il tourne avec le moteur LuaTeX.

2 Introduction

L'extention fontspec permet à l'utilisateur de X_HT_EX ou LuaT_EX de charger des fontes OpenType dans un document L^eT_EX. L'installation de fontes n'est pas nécessaire et les fonctionnalités associées aux fontes sont sélectionnables et utilisables à merci tout au long du document

Sans fontspec, il est nécessaire d'écrire de lourds fichiers de définitions de fontes pour La Mériex, car la mécanique de sélection des fontes de La La Mécanique de sélection des fontes de La La Mécanique de sélection des fontes de La La La Méries (connue sous le nom « NFSS ») doit faire beaucoup de choses dans les coulisses pour offrir des commandes simples comme \emphou \bfseries. Avec un nombre incalculable de polices maintenant disponibles, toutefois, il devient de moins en moins souhaitable d'écrire ces fichiers de définition de fontes (. fd) pour chaque fonte à utiliser.

L'extension fontspec étant conçue pour fonctionner dans différents modes, cette documentation est divisée en sections pensées pour être relativement indépendantes. Néanmoins, les fonctionnalités basiques se comportent toutes de la même manière, ceci afin que les utilisateurs de fontspec avec X_HT_EX puissent avoir peu ou pas de difficultés à basculer vers LuaT_EX.

Ce manuel peut rentrer dans des niveaux de détails importants, dans la mesure où il y en a beaucoup d'éléments fins à présenter. Voir les documents d'exemple fontspec-xetex. tex et fontspec-luatex. tex pour un exemple minimal complet avec chaque moteur.

2.1 À propos de ce manuel

Ce document est composé avec pdfl^AT_EX en utilisant des exemples précompilés qui ont été générés par X_AT_EX ou par LuaT_EX. Vous pouvez regénérer ces exemples en retranchant les sous-répertoires doc-files/ et en composant le manuel avec l'instruction suivante :

pdflatex -shell-escape fontspec.dtx

Notez que la plupart des exemples utilisent des fontes qui ne sont pas inclus dans TEX Live ou MiKTeX, et que certaines d'entre elles sont des fontes non libres devant être achetées.

Je souhaiterai réduire le nombre des fontes non libres utilisées dans ce manuel. Si vous avez connaissance de fontes libres qui pourraient utilisées comme alternatives aux fontes de ce document, n'hésitez pas à me les suggérer. Finalement, si des aspects de cette

documentation ne sont pas assez clairs ou vous souhaitez suggérer d'autres exemples, écrivez-moi! (Les contributions sont tout particulièrement bienvenues.)

2.2 Remerciements

Cette extension n'aurait pas été possible sans le soutien – survenu tôt dans le projet et continu depuis lors — de l'auteur de XaTeX, Jonathan Kew. Quand j'ai commencé cette extension, il m'a guidé dans la bonne direction à de nombreuses reprises.

J'ai eu de très bons retours année après année pour des demandes de fonctionnalités, des questions sur la documentation, des rapports d'erreurs, des suggestions de fontes, tout ceci de la part de nombreuses personnes de par le monde. Merci beaucoup à vous tous.

Merci à David Perry et Markus Böhning pour les nombreuses améliorations apportées à la documentation et à David Perry une fois encore pour avoir contribué au texte de l'une des sections de ce manuel.

Je remercie tout particulièrement Khaled Hosny, qui a été la force motrice derrière le support de Lual-TEX, conduisant finalement à la version 2.0 de cette extension.

3 Chargement de l'extension et options

Pour une utilisation simple, aucune option d'extension n'est requise :

\usepackage{fontspec}

Les options d'extension seront présentées par la suite ; quelques détails préliminaires sont ici examinés :

xunicode L'extension xunicode de Ross Moore est maintenant automatiquement chargée pour les utilisateurs de XHATEX et LualATEX. Cette extension apporte une rétro-compatibilité avec les méthodes de LATEX pour accéder aux caractères spéciaux et accents (par exemple, \%, \\$, \textbullet, \"u et ainsi de suite) ainsi qu'à de nombreux autres caractères Unicode.

Pour les utilisateurs de X₃T_EX L'extension xltxtra ajoute quelques fonctionnalités mineures à X₃L²T_EX, incluant, par le biais de l'extension metalogo, la commande \XeTeX composant le logo de X₃T_EX. Alors que cette extension était précédemment recommandée, elle présente bien moins d'intérêt de nos jours et n'est généralement pas requise. Pensez à consulter sa documentation pour vérifier si ses fonctionnalités sont nécessaires ou pas avant de la charger.

Pour les utilisateurs de LuaTEX Afin de faire aux fontes par leur nom plutôt que par leur nom de fichier (*e.g.*, « Latin Modern Roman » plutôt que « ec-lmr10 »), vous pourrez avoir besoin d'exécuter le script luaotfload-tool distribué avec l'extension luaotfload. Notez que si vous n'exécutez pas ce script au préalable, la première fois que vous essaierez de compiler un document le traitement va rester figé jusqu'à plusieurs minutes (mais uniquement la première fois). N'hésitez pas à consulter la documentation de luaotfload pour plus d'informations.

babel L'extension babel n'est pas vraiment compatible! En particulier le vietnamien, le grec et l'hébreu a minima ne fonctionnent pas correctement, de ce que j'ai pu constater. Cependant, la situation devrait être meilleure avec les langues cyrilliques et latines — fontspec fait en sorte que ces fontes soient chargées correctement. L'extension polyglossia est recommendée en tant que version de remplacement moderne de babel.

3.1 Ajustements sur les fontes mathématiques

Par défaut, fontspec ajuste la configuration des mathématiques standards de LATEX afin de conserver les bons symboles de Computer Modern quand la fonte romaine change. Cependant, ce comportement est évité si une autre extension chargeant d'autres fontes mathématiques est utilisée (telle que mathpazo ou l'extension unicode-math). Si vous observez que fontspec change de manière incorrecte les fontes mathématiques alors qu'il n'aurait pas du intervenir, utilisez l'option d'extension [no-math] pour supprimer manuellement ces fontes mathématiques.

3.2 Configuration

Si vous souhaitez personnaliser n'importe quelle partie de l'interface de fontspec, vous pouvez le faire en créant votre propre fichier fontspec.cfg, ce dernier étant automatiquement chargé s'il est trouvé par XqTeX ou LuaTeX. Un fichier fontspec.cfg intégrant un petit nombre de paramétrages par défaut est distribué avec fontspec.

Pour paramétrer fontspec à votre convenance, utilisez ce fichier .cfg standard comme point de départ ou écrivez le vôtre en partant de rien. Ensuite, placez-le dans le même répertoire que votre document principal pour des cas ponctuels ou placez-le dans des répertoires dans lesquels XaTeX ou LuaTeX cherchent par défaut sinon; par exemple avec MacTeX: ~/Library/texmf/tex/latex/.

L'option d'extension [no-config] supprime le chargement du fichier fontspec.cfg en toutes circonstances.

3.3 Alertes

Cette extension peut générer de nombreuses alertes qui peuvent être sans risques si vous savez ce que vous faites. Utilisez l'option d'extension [quiet] pour faire écrire ces avertissements dans le fichier journal (.log) à la place.

Utilisez l'option d'extension [silent] pour complétement supprimer ces alertes si vous ne souhaitez pas encombrer le fichier .log.

Première partie

Sélection générale de fontes

Cette section concerne les différentes commandes qui peuvent être utilisées pour sélectionner des fontes. *

These are the main font-selecting commands of this package. The \fontspec command selects a font for one-time use; all others should be used to define the standard fonts used in a document, as shown in Example 1. Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The Scale font feature will be discussed further in Section 7 on page 18, including methods for automatic scaling.

The font features argument accepts comma separated $\langle font\ feature \rangle = \langle option \rangle$ lists; these are described in later:

Example 1: Loading the default, sans serif, and monospaced fonts.

\setmainfont{TeX Gyre Bonum}
\setsansfont{Latin Modern Sans}[Scale=MatchLowercase]
\setmonofont{Inconsolata}[Scale=MatchLowercase]

- For general font features, see Section 7 on page 18
- For OpenType fonts, see Part II on page 22
- For XaTeX-only general font features, see Part IV on page 39
- For LuaT_EX-only general font features, see Part III on page 37
- For features for AAT fonts in X₂T_EX, see Section 12 on page 41

4 Font selection

In both LuaTEX and XETEX, fonts can be selected either by 'font name' or by 'file name'.

4.1 By font name

Fonts known to LuaTeX or XeTeX may be loaded by their standard names as you'd speak them out loud, such as *Times New Roman* or *Adobe Garamond*. 'Known to' in this case generally means 'exists in a standard fonts location' such as ~/Library/Fonts on Mac OS X, or C:\Windows\Fonts on Windows.

The simplest example might be something like

```
\setmainfont{Cambria}[ ... ]
```

in which the bold and italic fonts will be found automatically (if they exist) and are immediately accessible with the usual \textit and \textbf commands.

TODO: add explanation for how to find out what the 'font name' is.

4.2 By file name

X_TIEX and LuaTeX also allow fonts to be loaded by file name instead of font name. When you have a very large collection of fonts, you will sometimes not wish to have them all installed in your system's font directories. In this case, it is more convenient to load them from a different location on your disk. This technique is also necessary in X_TIEX when loading OpenType fonts that are present within your TEX distribution, such as /usr/local/texlive/2013/texmf-dist/fonts/opentype/public. Fonts in such locations are visible to X_TIEX but cannot be loaded by font name, only file name; LuaTeX does not have this restriction.

When selecting fonts by file name, any font that can be found in the default search paths may be used directly (including in the current directory) without having to explicitly define the location of the font file on disk.

Fonts selected by filename must include bold and italic variants explicitly.

```
\setmainfont{texgyrepagella-regular.otf}[
    BoldFont = texgyrepagella-bold.otf ,
    ItalicFont = texgyrepagella-italic.otf ,
    BoldItalicFont = texgyrepagella-bolditalic.otf ]
```

fontspec knows that the font is to be selected by file name by the presence of the '.otf' extension. An alternative is to specify the extension separately, as shown following:

```
\setmainfont{texgyrepagella-regular}[
    Extension = .otf ,
    BoldFont = texgyrepagella-bold ,
    ... ]
```

If desired, an abbreviation can be applied to the font names based on the mandatory 'font name' argument:

```
\setmainfont{texgyrepagella}[
    Extension = .otf ,
    UprightFont = *-regular ,
    BoldFont = *-bold ,
    ... ]
```

In this case 'texgyrepagella' is no longer the name of an actual font, but is used to construct the font names for each shape; the * is replaced by 'texgyrepagella'. Note in this case that UprightFont is required for constructing the font name of the normal font to use.

To load a font that is not in one of the default search paths, its location in the filesystem must be specified with the Path feature :

Note that XaTeX and LuaTeX are able to load the font without giving an extension, but fontspec must know to search for the file; this can can be indicated by declaring the font exists in an 'ExternalLocation':

```
\setmainfont{texgyrepagella-regular}[
    ExternalLocation ,
    BoldFont = texgyrepagella-bold ,
    ... ]
```

To be honest, Path and ExternalLocation are actually the same feature with different names. The former can be given without an argument and the latter can be given with one; the different names are just for clarity.

5 New commands to select font families

For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling \fontspec for every use. While the \fontspec command does not define a new font instance after the first call, the feature options must still be parsed and processed.

\newfontfamily

For this reason, new commands can be created for loading a particular font family with

Example 2: Defining new font families. \text{\newfontfamily\notefont{Kurier}} \text{\notefont This is a \emph{\note}.} \text{Example 3: Defining a single font face.}

\newfontface\fancy{Hoefler Text Italic}%
 [Contextuals={WordInitial,WordFinal}]
\fancy where is all the vegemite
% \emph, \textbf, etc., all don't work

where is all the vegemite

the \newfontfamily command, demonstrated in Example 2. This macro should be used to create commands that would be used in the same way as \rmfamily, for example. If you would like to create a command that only changes the font inside its argument (i.e., the same behaviour as \emph) define it using regular LaTeX commands:

```
\newcommand\textnote[1]{{\notefont #1}}
\textnote{This is a note.}
```

Note that the double braces are intentional; the inner pair are used to to delimit the scope of the font change.

\newfontface

Sometimes only a specific font face is desired, without accompanying italic or bold variants being automatically selected. This is common when selecting a fancy italic font, say, that has swash features unavailable in the upright forms. \newfontface is used for this purpose, shown in Example 3, which is repeated in Section 12.4 on page 41.

Comment for advanced users: The commands defined by \newfontface and \newfontfamily include their encoding information, so even if the document is set to use a legacy TeX encoding, such commands will still work correctly. For example,

```
\documentclass{article}
\usepackage{fontspec}
\newfontfamily\unicodefont{Lucida Grande}
\usepackage{mathpazo}
\usepackage[T1]{fontenc}
\begin{document}
A legacy \TeX\ font. {\unicodefont A unicode font.}
\end{document}
```

5.1 More control over font shape selection

```
\label{eq:boldFont} \begin{split} & \operatorname{BoldFont} = \langle font \ name \rangle \\ & \operatorname{ItalicFont} = \langle font \ name \rangle \\ & \operatorname{BoldItalicFont} = \langle font \ name \rangle \\ & \operatorname{SlantedFont} = \langle font \ name \rangle \\ & \operatorname{BoldSlantedFont} = \langle font \ name \rangle \\ & \operatorname{SmallCapsFont} = \langle font \ name \rangle \end{split}
```

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching accompanying shapes from

Example 4: Explicit selection of the bold font.

Helvetica Neue UltraLight Helvetica Neue UltraLight Italic

Helvetica Neue Helvetica Neue Italic

a different font altogether, others can have a range of bold and italic fonts to chose among. The BoldFont and ItalicFont features are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the *new* font. See Example 4.

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the BoldItalicFont feature is provided.

5.1.1 Input shorthands

For those cases that the base font name is repeated, you can replace it with an asterisk. (This has been shown previously in Section 4.2 on page 6.) For example, some space can be saved instead of writing 'Baskerville SemiBold':

```
\setmainfont{Baskerville}[BoldFont={* SemiBold}]

As a matter of fact, this feature can also be used for the upright font too:
\setmainfont{Baskerville}[UprightFont={* SemiBold},BoldFont={* Bold}]
```

5.1.2 Small caps and slanted font shapes

For the rare situations where a font family will have slanted *and* italic shapes, these may be specified separately using the analogous features SlantedFont and BoldSlantedFont. Without these, however, the LaTeX font switches for slanted (\textsl, \slshape) will default to the italic shape.

Old-fashioned font families used to distribute their small caps glyphs in separate fonts due to the limitations on the number of glyphs allowed in the PostScript Type 1 format. Such fonts may be used by declaring the SmallCapsFont of the family you are specifying:

```
\fontspec{Minion MM Roman}[
    SmallCapsFont={Minion MM Small Caps & Oldstyle Figures}
]
Roman 123 \\ \textsc{Small caps 456}
In fact, you may specify the small caps font for each individual bold and italic shape as in
\fontspec{ <upright> }[
    UprightFeatures = { SmallCapsFont={ <sc> } },
    BoldFeatures = { SmallCapsFont={ <bf sc> } },
    ItalicFeatures = { SmallCapsFont={ <it sc> } },
    BoldItalicFeatures = { SmallCapsFont={ <it sc> } },
    BoldItalicFeatures = { SmallCapsFont={ <bf it sc> } },
    Roman 123 \\ \textsc{Small caps 456}
```

For most modern fonts that have small caps as a font feature, this level of control isn't generally necessary, but you may still occasionally find font families in which the small caps are in a separate font.

All of the bold, italic, and small caps fonts can be loaded with different font features from the main font. See Section 6.5 for details. When an OpenType font is selected for SmallCapsFont, the small caps font feature is *not* automatically enabled. In this case, users should write instead, if necessary,

```
\fontspec{...}[
   SmallCapsFont={...},
   SmallCapsFeatures={Letters=SmallCaps},
```

5.2 Specifically choosing the NFSS family

In LATEX's NFSS, font families are defined with names such as 'ppl' (Palatino), 'cmr' (Computer Modern Roman), and so on, which are selected with the \fontfamily command:

```
\fontfamily{ppl}\selectfont
```

In fontspec, the family names are auto-generated based on the fontname of the font; for example, writing \fontspec{Times New Roman} for the first time would generate an internal font family name of 'TimesNewRoman(1)'.

In certain cases it is desirable to be able to choose this internal font family name so it can be re-used elsewhere for interacting with other packages that use the \LaTeX font selection interface; an example might be

```
\usepackage{fancyvrb}
\fvset{fontfamily=myverbatimfont}
```

To select a font for use in this way in fontspec use the NFSSFamily feature: 1

\newfontfamily\verbatimfont[NFSSFamily=myverbatimfont]{Inconsolata}

It is then possible to write commands such as:

```
\fontfamily{myverbatimfont}\selectfont
```

which is essentially the same as writing \verbatimfont, or to go back to the orginal example:

```
\fvset{fontfamily=myverbatimfont}
```

Only use this feature when necessary; the in-built font switching commands that fontspec generates (such as \verbatimfont in the example above) are recommended in all other cases.

If you don't wish to explicitly set the NFSS family but you would like to know what it is, an alternative mechanism for package writers is introduced as part of the fontspec programming interface; see the function \fontspec_set_family: Nnn for details (Section 16 on page 47).

5.3 Choosing additional NFSS font faces

Leteral Letera

^{1.} Thanks to Luca Fascione for the example and motivation for finally implementing this feature.

If you set up a regular font family with the 'standard four' (upright, bold, italic, and bold italic) shapes and then want to use, say, a light font for a certain document element, many users will be perfectly happy to use $\mbox{newfontface}\space{switch}$ and use the resulting font \space{switch} . In other cases, however, it is more convenient or even necessary to load additional fonts using additional NFSS specifiers.

```
FontFace = {\langle series \rangle}{\langle shape \rangle} { Font = \langle font\ name \rangle, \langle features \rangle} FontFace = {\langle series \rangle}{\langle shape \rangle}{\langle font\ name \rangle}
```

The font thus specified will inherit the font features of the main font, with optional addition $\langle features \rangle$ as requested. (Note that the optional $\{\langle features \rangle\}$ argument is still surrounded with curly braces.) Multiple FontFace commands may be used in a single declaration to specify multiple fonts. As an example :

```
\setmainfont{font1.otf}[
  FontFace = {c}{n}{ font2.otf } ,
  FontFace = {c}{m}{ Font = font3.otf , Color = red }
]
```

Writing \fontseries(c)\selectfont will result in font2 being selected, which then followed by \fontshape{m}\selectfont will result in font3 being selected (in red). A font face that is defined in terms of a different series but a normal shape will attempt to find a matching small caps feature and define that face as well if appropriate. Conversely, a font faced defined in terms of a different font will not.

There are some standards for choosing shape and series codes; the LaTeX 2_{ϵ} font selection guide 2 lists series m for medium, b for bold, bx for bold extended, sb for semi-bold, and c for condensed. A far more comprehensive listing is included in Appendix A of Philipp Lehman's 'The Font Installation Guide' covering 14 separate weights and 12 separate widths.

The FontFace command also interacts properly with the SizeFeatures command as follows: (nonsense set of font selection choices)

Note that if the first Font feature is omitted then each size needs its own inner Font declaration.

5.4 Math(s) fonts

When \setmainfont, \setsansfont and \setmonofont are used in the preamble, they also define the fonts to be used in maths mode inside the \mathrm-type commands. This only occurs in the preamble because LaTeX freezes the maths fonts after this stage of the processing. The fontspec package must also be loaded after any maths font packages (e.g., euler) to be successful. (Actually, it is only euler that is the problem. \(^4\))

- 2. texdoc fntguide
- 3. texdoc fontinstallationguide
- 4. Speaking of euler, if you want to use its [mathbf] option, it won't work, and you'll need to put this after fontspec is loaded instead: $\added [U]_{ur}_{b}^{0}$

Note that fontspec will not change the font for general mathematics; only the upright and bold shapes will be affected. To change the font used for the mathematical symbols, see either the mathspec package or the unicode-math package.

Note that you may find that loading some maths packages won't be as smooth as you expect since fontspec (and X_TT_EX in general) breaks many of the assumptions of T_EX as to where maths characters and accents can be found. Contact me if you have troubles, but I can't guarantee to be able to fix any incompatibilities. The Lucida and Euler maths fonts should be fine; for all others keep an eye out for problems.

However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so on). For this reason, you may optionally use the commands above (in the same way as our other \fontspeclike commands) to explicitly state which fonts to use inside such commands as \mathrm. Additionally, the \setboldmathrm command allows you define the font used for \mathrm when in bold maths mode (which is activated with, among others, \boldmath).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble :

```
\usepackage{mathpazo}
\usepackage{fontspec,xunicode}
\setmainfont{Optima}
\setmathrm{Optima}
\setboldmathrm[BoldFont={Optima ExtraBlack}]{Optima Bold}
```

5.5 Miscellaneous font selecting details

The optional argument — **from v2.4** For the first decade of fontspec's life, optional font features were selected with a bracketed argument before the font name, as in :

```
\setmainfont[
  lots and lots ,
  and more and more ,
  an excessive number really ,
  of font features could go here
]{myfont.otf}
```

This always looked like ugly syntax to me, and the order of these arguments has now been reversed:

```
\setmainfont{myfont.otf}[
  lots and lots ,
  and more and more ,
  an excessive number really ,
  of font features could go here
```

I hope this doesn't cause any problems.

1. Backwards compatibility has been preserved. (In fact, you could even write

```
\fontspec[Ligatures=Rare]{myfont.otf}[Color=red]
if you really felt like it and both sets of features would be applied.)
```

2. Following standard xparse behaviour, there must be no space before the opening bracket; writing

```
\fontspec{myfont.otf}_[Color=red]
```

will result in [Color=red] not being recognised an argument and therefore it will be typeset as text. When breaking over lines, write either of:

```
\fontspec{myfont.otf}% \fontspec{myfont.otf}[
[Color=red] Color=Red]
```

Spaces \fontspec and \addfontfeatures ignore trailing spaces as if it were a 'naked' control sequence; e.g., 'M. \fontspec{...} N' and 'M. \fontspec{...}N' are the same.

Italic small caps Note that this package redefines the \itshape and \scshape commands in order to allow them to select italic small caps in conjunction.

Emphasis and nested emphasis You may specify the behaviour of the \emph command by setting the \emph command. *E.g.*, for bold emphasis :

```
\renewcommand\emshape{\bfseries}
```

Nested emphasis is controlled by the $\ensuremath{\verb| emph{...}|}$ to produce small caps:

\renewcommand\eminnershape{\scshape}

This functionality is provided with the same interface as the fixltx2e package, with a slightly different internal implementation.

6 Selecting font features

The commands discussed so far such as \fontspec each take an optional argument for accessing the font features of the requested font. Commands are provided to set default features to be applied for all fonts, and even to change the features that a font is presently loaded with. Different font shapes can be loaded with separate features, and different features can even be selected for different sizes that the font appears in. This section discusses these options.

6.1 Default settings

```
\defaultfontfeatures{\langle font features \rangle}
```

It is sometimes useful to define font features that are applied to every subsequent font selection command. This may be defined with the \defaultfontfeatures command, shown in Example 5. New calls of \defaultfontfeatures overwrite previous ones, and defaults can be reset by calling the command with an empty argument.

```
\\defaultfontfeatures[\langle font name \rangle] \{\langle font features \rangle \}
```

Default font features can be specified on a per-font and per-face basis by using the optional argument to \defaultfontfeatures as shown.⁵

```
\defaultfontfeatures[TeX Gyre Adventor]{Color=blue}
\setmainfont{TeX Gyre Adventor}% will be blue
```

5. Internally, *(font name)* has all spaces removed and is converted to lowercase.

Example 5: A demonstration of the \defaultfontfeatures command.

```
\fontspec{TeX Gyre Adventor}
Some default text 0123456789 \\
\defaultfontfeatures{
    Numbers=OldStyle, Color=888888
}
\fontspec{TeX Gyre Adventor}
Now grey, with old-style figures:
0123456789
```

Some default text 0123456789

Now grey, with old-style figures: 0123456789

Multiple fonts may be affected by using a comma separated list of font names.

New in v2.4. Defaults can also be applied to symbolic families such as those created with the \newfontfamily command and for \rmfamily, \sffamily, and \ttfamily:

```
\defaultfontfeatures[\rmfamily,\sffamily]{Ligatures=TeX}
\setmainfont{TeX Gyre Adventor}% will use standard TeX ligatures
```

The line above to set TEX-like ligatures is now activated by *default* in fontspec.cfg. To reset default font features, simply call the command with an empty argument:

```
\defaultfontfeatures[\rmfamily,\sffamily]{}
\setmainfont{TeX Gyre Adventor}% will no longer use standard TeX ligatures
```

New in v2.4. Using the + form of the command appends the $\langle font \, features \rangle$ to any already-selected defaults.

6.2 Default settings from a file

In addition to the defaults that may be specified in the document as described above, when a font is first loaded, a configuration file is searched for with the name $\langle fontname \rangle$. fontspec'.

The contents of this file can be used to specify default font features without having to have this information present within each document. $\langle fontname \rangle$ is stripped of spaces and file extensions are omitted; for example, the line above for TEX Gyre Adventor could be placed in a file called TeXGyreAdventor. fontspec, or for specifying options for texgyreadventor-regular.otf (when loading by filename), the configuration file would be texgyreadventor-regular.fontspec. (N.B. the lettercase of the names should match.)

This mechanism can be used to define custom names or aliases for your font collections. If you create a file MyCharis. fontspec containing, say,

```
\defaultfontfeatures[My Charis]
{
   Extension = .ttf ,
   UprightFont = CharisSILR,
   BoldFont = CharisSILB,
```

6. Located in the current folder or within a standard texmf location.

```
ItalicFont = CharisSILI,
BoldItalicFont = CharisSILBI,
% <any other desired options>
}
```

you can load that custom family with \fontspec{My Charis} and similar. The optional argument to \defaultfontfeatures must match that requested by the font loading command (\fontspec, etc.), else the options won't take effect.

Finally, note that options for font faces can also be defined in this way. To continue the example above, here we colour the different faces :

```
\defaultfontfeatures[CharisSILR]{Color=blue}
\defaultfontfeatures[CharisSILB]{Color=red}
```

And such configuration lines can be stored either inline inside My Charis. fontspec or within their own .fontspec files; in this way, fontspec is designed to handle 'nested' configuration options as well.

6.3 Changing the currently selected features

```
\addfontfeatures\{\langle font\ features\rangle\}
```

This command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in Example 6. Note however that the behaviour in this regard will be unreliable (subject to the font itself) if you attempt to *change* an already selected feature. *E.g.*, this sort of thing can cause troubles:

```
\addfontfeature{Numbers=OldStyle}...
\addfontfeature{Numbers=Lining}...
123
```

With both features active, how will the font render '123'? Depends on the font. In the distant future this functionality will be re-written to avoid this issue (giving 'Numbers=0ldStyle' the smarts to know to explicitly de-activate any previous instances of 'Numbers=Lining', and vice-versa, but as I hope you can imagine this requires a fair degree of elbow grease which I haven't had available for some time now.

\addfontfeature

This command may also be executed under the alias \addfontfeature.

6.4 Priority of feature selection

Features defined with \addfontfeatures override features specified by \fontspec, which in turn override features specified by \defaultfontfeatures. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (.log) file displaying the font name and the features requested.

6.5 Different features for different font shapes

```
BoldFeatures={\(\frac{features}\)\}
ItalicFeatures={\(\frac{features}\)\}
BoldItalicFeatures={\(\frac{features}\)\}
SlantedFeatures={\(\frac{features}\)\}
BoldSlantedFeatures={\(\frac{features}\)\}
SmallCapsFeatures={\(\frac{features}\)\}
```

Example 6: A demonstration of the \addfontfeatures command. Note the caveat listed in the text regarding such usage.

'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.'

```
        Year
        People
        Miles
        Boats

        1842
        999
        75
        13

        1923
        111
        54
        56
```

Example 7: Features for, say, just italics.

ATTENTION ALL MARTINI DRINKERS
ATTENTION ALL MARTINI DRINKERS

```
\fontspec{Hoefler Text} \itshape \scshape
Attention All Martini Drinkers \\
\addfontfeature{ItalicFeatures={Alternate = 1}}
Attention All Martini Drinkers \\
```

It is entirely possible that separate fonts in a family will require separate options; *e.g.*, Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional \fontspec argument are applied to *all* shapes of the family. Using Upright-, SmallCaps-, Bold-, Italic-, and BoldItalicFeatures, separate font features may be defined to their respective shapes *in addition* to, and with precedence over, the 'global' font features. See Example 7.

Note that because most fonts include their small caps glyphs within the main font, features specified with SmallCapsFeatures are applied *in addition* to any other shape-specific features as defined above, and hence SmallCapsFeatures can be nested within ItalicFeatures and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the somewhat ludicrous Example 8.

6.6 Different features for different font sizes

```
SizeFeatures = {
...
{ Size = \( \size \) range \\ , \\ \font features \\ },
{ Size = \( \size \) range \\ , \\ Font = \\ \font name \\ , \\ \font features \\ },
...
}
```

The SizeFeature feature is a little more complicated than the previous features discussed. It allows different fonts and different font features to be selected for a given font family

Example 8: An example of setting the SmallCapsFeatures separately for each font shape.

```
\fontspec{TeX Gyre Termes}[
                                        UprightFeatures={Color = 220022,
                                             SmallCapsFeatures = {Color=115511}},
                                         ItalicFeatures={Color = 2244FF,
                                             SmallCapsFeatures = {Color=112299}},
                                           BoldFeatures={Color = FF4422,
                                             SmallCapsFeatures = {Color=992211}},
                                    BoldItalicFeatures={Color = 888844,
                                            SmallCapsFeatures = {Color=444422}},
Upright SMALL CAPS
                                   Upright {\scshape Small Caps}\\
Italic Italic Small Caps
                                   \itshape Italic {\scshape Italic Small Caps}\\
Bold Bold Small Caps
                                    \upshape\bfseries Bold {\scshape Bold Small Caps}\\
Bold Italic Bold Italic Small Caps
                                   \itshape Bold Italic {\scshape Bold Italic Small Caps}
```

Example 9: An example of specifying different font features for different sizes of font with SizeFeatures.

as the point size varies.

It takes a comma separated list of braced, comma separated lists of features for each size range. Each sub-list must contain the Size option to declare the size range, and optionally Font to change the font based on size. Other (regular) fontspec features that are added are used on top of the font features that would be used anyway. A demonstration to clarify these details is shown in Example 9. A less trivial example is shown in the context of optical font sizes in Section 7.6 on page 21.

To be precise, the Size sub-feature accepts arguments in the form shown in **Table 1** on the following page. Braces around the size range are optional. For an exact font size (Size=X) font sizes chosen near that size will 'snap'. For example, for size definitions at exactly 11pt and 14pt, if a 12pt font is requested *actually* the 11pt font will be selected. This is a remnant of the past when fonts were designed in metal (at obviously rigid sizes) and later when bitmap fonts were similarly designed for fixed sizes.

If additional features are only required for a single size, the other sizes must still be specified. As in :

```
SizeFeatures={
    {Size=-10,Numbers=Uppercase},
    {Size=10-}}
```

Otherwise, the font sizes greater than 10 won't be defined at all!

Table 1 – Syntax for specifying the size to apply custom font features.

Input	Font size, s		
Size = X-	$s \geqslant X$		
Size = -Y	s < Y		
Size = X-Y	$X \leqslant s < Y$		
Size = X	s = X		

Example 10: Selecting colour with transparency. N.B. due to a conflict betweeen fontspec and the preview package, this example currently does not show any transparency!

```
\fontsize{48}{48}
\fontspec{TeX Gyre Bonum Bold}
{\addfontfeature{Color=FF000099}W}\kern-0.5ex
{\addfontfeature{Color=0000FF99}S}\kern-0.4ex
{\addfontfeature{Color=DDBB2299}P}\kern-0.4ex
{\addfontfeature{Color=00BB3399}R}
```

Interaction with other features For SizeFeatures to work with ItalicFeatures, BoldFeatures, etc., and SmallCapsFeatures, a strict heirarchy is required:

```
UprightFeatures =
{
    SizeFeatures =
    {
        Size = -10,
        Font = ..., % if necessary
        SmallCapsFeatures = {...},
        ... % other features for this size range
    },
        ... % other size ranges
    }
}
```

Suggestions on simplifying this interface welcome.

7 Font independent options

Features introduced in this section may be used with any font.

7.1 Colour

Color (or Colour), also shown in Section 6.1 on page 13 and elsewhere, uses font specifications to set the colour of the text. The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where 00 is completely transparent and FF is opaque.) Transparency is supported by Lual*TEX; XTL*TEX with the xdvipdfmx driver does not support this feature.

If you load the xcolor package, you may use any named colour instead of writing the colours in hexadecimal.

Example 11: Automatically calculated scale values.

\setmainfont{Georgia}
\newfontfamily\lc[Scale=MatchLowercase]{Verdana}
The perfect match {\lc is hard to find.}\\
\newfontfamily\uc[Scale=MatchUppercase]{Arial}
L O G O \uc F O N T

The perfect match is hard to find. LOGOFONT

```
\usepackage{xcolor}
...
\fontspec[Color=red]{Verdana} ...
\definecolor{Foo}{rgb}{0.3,0.4,0.5}
\fontspec[Color=Foo]{Verdana} ...
```

The color package is *not* supported; use xcolor instead.

You may specify the transparency with a named colour using the Opacity feature which takes an decimal from zero to one corresponding to transparent to opaque respectively:

```
\fontspec[Color=red,Opacity=0.7]{Verdana} ...
```

It is still possible to specify a colour in six-char hexadecimal form while defining opacity in this way, if you like.

7.2 Scale

```
Scale = \langle number \rangle
Scale = MatchLowercase
Scale = MatchUppercase
```

In its explicit form, Scale takes a single numeric argument for linearly scaling the font, as demonstrated in Example 1. It is now possible to measure the correct dimensions of the fonts loaded and calculate values to scale them automatically.

As well as a numerical argument, the Scale feature also accepts options MatchLowercase and MatchUppercase, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively; these features are shown in Example 11.

The amount of scaling used in each instance is reported in the .log file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

Note that when Scale=MatchLowercase is used with \setmainfont, the new 'main' font of the document will be scaled to match the old default. This may be undesirable in some cases, so to achieve 'natural' scaling for the main font but automatically scale all other fonts selected, you may write

```
\defaultfontfeatures{ Scale = MatchLowercase }
\defaultfontfeatures[\rmfamily]{ Scale = 1}
```

One or both of these lines may be placed into a local fontspec.cfg file (see Section 3.2 on page 5) for this behaviour to be effected in your own documents automatically. (Also see Section 6.1 on page 13 for more information on setting font defaults.)

Example 12: Scaling the default interword space. An exaggerated value has been chosen to emphasise the effects here.

Some text for our example to take up some space, and to demonstrate the default interword space.

Some text for our example to take up some space, and to demonstrate the default interword space.

\fontspec{TeX Gyre Termes}
Some text for our example to take
up some space, and to demonstrate
the default interword space.
\bigskip

\addfontfeature{ WordSpace = 0.3 }
Some text for our example to take
up some space, and to demonstrate
the default interword space.

Example 13: Scaling the default post-punctuation space.

\nonfrenchspacing
\fontspec{TeX Gyre Schola}
Letters, Words. Sentences.

\text{Nords. Sentences.} \par
\fontspec{TeX Gyre Schola}[PunctuationSpace=0]
\text{Letters, Words. Sentences.} \text{Letters, Words. Sentences.}

7.3 Interword space

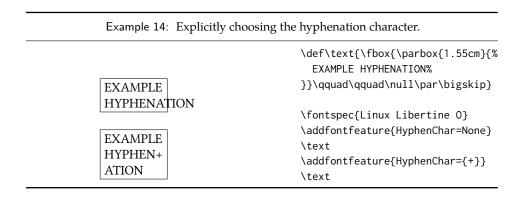

While the space between words can be varied on an individual basis with the TEX primitive \spaceskip command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically, and generally will not need to be adjusted. For those times when the precise details are important, the WordSpace feature is provided, which takes either a single scaling factor to scale the default value, or a triplet of comma-separated values to scale the nominal value, the stretch, and the shrink of the interword space by, respectively. (WordSpace= $\{x\}$ is the same as WordSpace= $\{x,x,x\}$.)

7.4 Post-punctuation space

If \frenchspacing is *not* in effect, TEX will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The PunctuationSpace feature takes a scaling factor by which to adjust the nominal value chosen for the font; this is demonstrated in Example 13. Note that PunctuationSpace=0 is *not* equivalent to \frenchspacing, although the difference will only be apparent when a line of text is under-full.

Example 15: A demonstration of automatic optical size selection.

\fontspec{Latin Modern Roman}
Automatic optical size \\
Automatic optical size}

7.5 The hyphenation character

The letter used for hyphenation may be chosen with the HyphenChar feature. It takes three types of input, which are chosen according to some simple rules. If the input is the string None, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

This package redefines LATEX's \- macro such that it adjusts along with the above changes.

7.6 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by $X_{\overline{1}}T_{\overline{1}}X$ and LuaT_EX *automatically* determined by the current font size as in Example 15, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes.

The OpticalSize option may be used to specify a different optical size. With OpticalSize set to zero, no optical size font substitution is performed, as shown in Example 16.

The SizeFeatures feature (Section 6.6 on page 16) can be used to specify exactly which optical sizes will be used for ranges of font size. For example, something like:

Example 16: Optical size substitution is suppressed when set to zero.

Latin Modern optical sizes Latin Modern optical sizes Latin Modern optical sizes Latin Modern optical sizes \fontspec{Latin Modern Roman 5 Regular}[OpticalSize=0]

Deuxième partie OpenType

8 Introduction

OpenType fonts (and other 'smart' font technologies such as AAT and Graphite) can change the appearance of text in many different ways. These changes are referred to as features. When the user applies a feature — for example, small capitals — to a run of text, the code inside the font makes appropriate adjustments and small capitals appear in place of lowercase letters. However, the use of such features does not affect the underlying text. In our small caps example, the lowercase letters are still stored in the document; only the appearance has been changed by the OpenType feature. This makes it possible to search and copy text without difficulty. If the user selected a different font that does not support small caps, the 'plain' lowercase letters would appear instead.

Some OpenType features are required to support particular scripts, and these features are often applied automatically. The scripts used in India, for example, often require that characters be reshaped and reordered after they are typed by the user, in order to display them in the traditional ways that readers expect. Other features can be applied to support a particular language. The Junicode font for medievalists uses by default the Old English shape of the letter thorn, while in modern Icelandic thorn has a more rounded shape. If a user tags some text as being in Icelandic, Junicode will automatically change to the Icelandic shape through an OpenType feature that localizes the shapes of letters.

A very large group of OpenType features is designed to support high quality typography in Latin, Greek, Cyrillic and other standard scripts. Examples of some font features have already been shown in previous sections; the complete set of OpenType font features supported by fontspec is described below in Section 9.

The OpenType specification provides four-letter codes (e.g., smcp for small capitals) for each feature. The four-letter codes are given below along with the fontspec names for various features, for the benefit of people who are already familiar with OpenType. You can ignore the codes if they don't mean anything to you.

8.1 How to select font features

Font features are selected by a series of $\langle feature \rangle = \langle option \rangle$ selections. Features are (usually) grouped logically; for example, all font features relating to ligatures are accessed by writing

Table 2 – Options for the OpenType font feature 'Ligatures'.

Feature	Option		Tag
Ligatures =	Required NoRequired Common NoCommon Contextual NoContextual Rare/Discretionary Historic TeX	*	rlig rlig (deactivate) liga liga (deactivate) clig clig (deactivate) dlig hlig tlig/trep

^{*} This feature is activated by default.

Ligatures= $\{\ldots\}$ with the appropriate argument(s), which could be TeX, Rare, etc., as shown below in Section 9.1.

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; Numbers={OldStyle,Lining} doesn't make much sense because the two options are mutually exclusive, and XaTeX will simply use the last option that is specified (in this case using Lining over OldStyle).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in Section 3.3 on page 5 these warnings can be suppressed by selecting the [quiet] package option.

9 Complete listing of OpenType font features

9.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. The list of options, of which multiple may be selected at one time, is shown in Table 2. A demonstration with the Linux Libertine fonts ⁷ is shown in Example 17.

Note the additional features accessed with Ligatures=TeX. These are not actually real OpenType features, but additions provided by luaotfload (i.e., LuaTeX only) to emulate TeX's behaviour for ASCII input of curly quotes and punctuation. In XeTeX this is achieved with the Mapping feature (see Section 11.1 on page 39) but for consistency Ligatures=TeX will perform the same function as Mapping=tex-text.

9.2 Letters

The Letters feature specifies how the letters in the current font will look. OpenType fonts may contain the following options: Uppercase, SmallCaps, PetiteCaps, UppercaseSmallCaps, UppercasePetiteCaps, and Unicase.

Petite caps are smaller than small caps. SmallCaps and PetiteCaps turn lowercase letters into the smaller caps letters, whereas the Uppercase... options turn the *capital* letters into the smaller caps (good, *e.g.*, for applying to already uppercase acronyms like 'NASA'). This

Table 3 – Options for the OpenType font feature 'Letters'.

Feature	Option	Tag
Letters =	Uppercase SmallCaps	case
	PetiteCaps	рсар
	UppercaseSmallCaps UppercasePetiteCaps	
	Unicase	unic

difference is shown in Example 18. 'Unicase' is a weird hybrid of upper and lower case letters.

Note that the Uppercase option will (probably) not actually map letters to uppercase. ⁸ It is designed to select various uppercase forms for glyphs such as accents and dashes, such as shown in Example 19; note the raised position of the hyphen to better match the surrounding letters.

The Kerning feature also contains an Uppercase option, which adds a small amount of spacing in between letters (see Section 9.12 on page 32).

9.3 Numbers

The Numbers feature defines how numbers will look in the selected font, accepting options shown in Table 4.

The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in Section 6.3 on page 15. The Monospaced

8. If you want automatic uppercase letters, look to LATEX's \MakeUppercase command.

Example 18: Small caps from lowercase or uppercase letters.

Table 4 – Options for the OpenType font feature 'Numbers'.

Feature	Option	Tag
Numbers =	Uppercase/Lining Lowercase/OldStyle Proportional	lnum onum pnum
	Monospaced SlashedZero	tnum zero
	Arabic	anum

option is useful for tabular material when digits need to be vertically aligned.

The SlashedZero option replaces the default zero with a slashed version to prevent confusion with an uppercase 'O', shown in Example 20.

The Arabic option (with tag anum) maps regular numerals to their Arabic script or Persian equivalents based on the current Language setting (see Section 9.18 on page 35), shown in Example 21 using the Persian Modern font, which is included in TeX Live and MiKTeX. This option is based on a LuaTeX feature of the luaotfload package, not an OpenType feature. (Thus, this feature is unavailable in XeTeX.)

9.4 Contextuals

This feature refers to substitutions of glyphs that vary 'contextually' by their relative position in a word or string of characters; features such as contextual swashes are accessed via the options shown in Table 5.

Historic forms are accessed in OpenType fonts via the feature Style=Historic; this is generally *not* contextual in OpenType, which is why it is not included in this feature.

9.5 Vertical Position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option will only raise characters that are used in some languages directly after

Example 20: The effect of the SlashedZero option.

Denominator: 12345 \fontspec{LibreCaslonText-Regular.otf}[VerticalPosition=ScientificInferior]

Scientific Inferior: 12345 Scientific Inferior: 12345

Table 7 – Options for the OpenType font feature 'Fractions'.

Feature	Option	Tag
Fractions =	On	frac
	Alternate	afro

a number. The ScientificInferior feature will move glyphs further below the baseline than the Inferior feature. These are shown in Example 22

Numerator and Denominator should only be used for creating arbitrary fractions (see next section).

The realscripts package (which is also loaded by xltxtra for XATEX) redefines the \textsubscript and \textsuperscript commands to use the above font features automatically, including for use in footnote labels. If this is the only feature of xltxtra you wish to use, consider loading realscripts on its own instead.

9.6 Fractions

For OpenType fonts use a regular text slash to create fractions, but the Fraction feature must be explicitly activated. Some (Asian fonts predominantly) also provide for the Alternate feature. These are both shown in Example 23.

Example 23: The Fractions feature.

\fontspec{Hiragino Maru Gothic Pro W4} 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\ 5/6 13579/24680 \addfontfeature{Fractions=On} 13579/24680 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\ 13579/24680 \addfontfeature{Fractions=Alternate} 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\

ENLARGED Minuscules. ENLARGED Minuscules.	\fontspec{Junicode} ENLARGED Minuscules. \\ \addfontfeature{StylisticSet=6} ENLARGED Minuscules. \\
--	---

9.7 Stylistic Set variations

This feature selects a 'Stylistic Set' variation, which usually corresponds to an alternate glyph style for a range of characters (usually an alphabet or subset thereof). This feature is specified numerically. These correspond to OpenType features ss01, ss02, etc.

Two demonstrations from the Junicode font ⁹ are shown in Example 24 and Example 25; thanks to Adam Buchbinder for the suggestion.

 $Multiple \ stylistic \ sets \ may \ be \ selected \ simultaneously \ by \ writing, e.g., \ Stylistic Set=\{1,2,3\}.$

The StylisticSet feature is a synonym of the Variant feature for AAT fonts. See Section 13 on page 45 for a way to assign names to stylistic sets, which should be done on a per-font basis.

9.8 Character Variants

Similar to the 'Stylistic Sets' above, 'Character Variations' are selected numerically to adjust the output of (usually) a single character for the particular font. These correspond to the OpenType features cv01 to cv99.

For each character that can be varied, it is possible to select among possible options for that particular glyph. For example, in Example **26** a variety of glyphs for the character 'v' are selected, in which 5 corresponds to the character 'v' for this font feature, and the trailing : $\langle n \rangle$ corresponds to which variety to choose. Georg Duffner's open source Garamond revival font ¹⁰ is used in this example. Character variants are specifically designed not to conflict with each other, so you can enable them individually per character as shown in Example **27**. (Unlike stylistic alternates, say.)

Note that the indexing starts from zero.

9.9 Alternates

The Alternate feature (for the raw OpenType feature salt) is used to access alternate font glyphs when variations exist in the font, such as in Example 28. It uses a numerical selection,

^{9.} http://junicode.sf.net

^{10.} http://www.georgduffner.at/ebgaramond/

TitlingCaps	titl
HorizontalKana	hkna
VerticalKana	vkna

starting from zero, that will be different for each font. Note that the Style=Alternate option is equivalent to Alternate=0 to access the default case.

Note that the indexing starts from zero.

See Section 13 on page 45 for a way to assign names to alternates, which must be done on a per-font basis.

9.10 Style

'Ruby' refers to a small optical size, used in Japanese typography for annotations. For fonts with multiple salt OpenType features, use the fontspec Alternate feature instead.

Example 29 and Example 30 both contain glyph substitutions with similar characteristics. Note the occasional inconsistency with which font features are labelled; a long-tailed 'Q' could turn up anywhere!

In other features, larger breadths of changes can be seen, covering the style of an entire alphabet. See Example 31 and Example 32; in the latter, the Italic option affects the Latin text and the Ruby option the Japanese.

Note the difference here between the default and the horizontal style kana in Example 33: the horizontal style is slightly wider.

^{*} This feature is activated by default.

Table 10 – Options for the OpenType font feature 'Kerning'.

Feature	Option	Tag	
Kerning =	Uppercase On Off	* kern	(deactivate)

^{*} This feature is activated by default.

9.11 Diacritics

Specifies how combining diacritics should be placed. These will usually be controlled automatically according to the Script setting.

9.12 Kerning

Specifies how inter-glyph spacing should behave. Well-made fonts include information for how differing amounts of space should be inserted between separate character pairs. This kerning space is inserted automatically but in rare circumstances you may wish to turn it off.

As briefly mentioned previously at the end of Section 9.2 on page 23, the Uppercase option will add a small amount of tracking between uppercase letters, seen in Example 34, which uses the Romande fonts ¹¹ (thanks to Clea F. Rees for the suggestion). The Uppercase option acts separately to the regular kerning controlled by the On/Off options.

Example 34: Adding extra kerning for uppercase letters. (The difference is usually very small.)

                           x0\x1\x2\x3\x4\x5\x6\x7\x7\x8\x9
```

9.13 Font transformations

In rare situations users may want to mechanically distort the shapes of the glyphs in the current font such as shown in Example 35. Please don't overuse these features; they are *not* a good alternative to having the real shapes.

If values are omitted, their defaults are as shown above.

If you want the bold shape to be faked automatically, or the italic shape to be slanted automatically, use the AutoFakeBold and AutoFakeSlant features. For example, the following two invocations are equivalent :

```
\fontspec[AutoFakeBold=1.5]{Charis SIL}
\fontspec[BoldFeatures={FakeBold=1.5}]{Charis SIL}
```

If both of the AutoFake... features are used, then the bold italic font will also be faked.

The FakeBold and AutoFakeBold features are only available with the XaTeX engine and will be ignored in LuaTeX.

9.14 Annotation

Some fonts are equipped with an extensive range of numbers and numerals in different forms. These are accessed with the Annotation feature (OpenType feature nalt), selected numerically as shown in Example 36.

Note that the indexing starts from zero.

Table 11 – Options for the OpenType font feature 'CJKShape'.

Feature	Option	Tag

吧吧 烟柳 外 开动	<pre>\text }</pre>	

9.15 CJK shape

There have been many standards for how CJK ideographic glyphs are 'supposed' to look. Some fonts will contain many alternate glyphs available in order to be able to display these gylphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

9.16 Character width

Many Asian fonts are equipped with variously spaced characters for shoe-horning into their generally monospaced text. These are accessed through the CharacterWidth feature.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by

Table 12 – Options for the OpenType font feature 'CharacterWidth'.

Feature	Option	Tag
CharacterWidth =	Full Half Third Quarter AlternateProportional	
	AlternateHalf	halt

\makebox[2.5cm][1]{\deftatb}}
\fontspec{Hiragino Mincho Pro}

ワカヨタレソ abcdef {\addfontfeature{CharacterWidth=Proportional}\test}\\
ワカヨタレソ abcdef {\addfontfeature{CharacterWidth=Full}\test}\\
7カヨタレソ abcdef {\addfontfeature{CharacterWidth=Half}\test}
```

Example 39: Numbers can be compressed significantly.

ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms seen in Example 39.

ようこそ

9.18 OpenType scripts and languages

Fonts that include glyphs for various scripts and languages may contain different font features for the different character sets and languages they support, and different font features may behave differently depending on the script or language chosen. When multilingual fonts are used, it is important to select which language they are being used for, and more importantly what script is being used.

The 'script' refers to the alphabet in use; for example, both English and French use the Latin script. Similarly, the Arabic script can be used to write in both the Arabic and Persian languages.

The Script and Language features are used to designate this information. The possible options are tabulated in Table 13 on page 37 and Table 14 on page 38, respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

Example 40: An example of various Scripts and Languages.

```
\testfeature{Script=Arabic}{\arabictext}
  મર્યાદા-સૂયક નવિદન ર્મયાદા-સૂયક નિવેદન
                                                \testfeature{Script=Devanagari}{\devanagaritext}
                                                \testfeature{Script=Bengali}{\bengalitext}
നമ്മടപൊരബര്യ നമ്മുടെ പാരബര്യ
                                                \testfeature{Script=Gujarati}{\gujaratitext}
    ਆਦ ਸਿਚੂ ਜੁਗਾਦ ਸਿਚੂ ਆਦਿ ਸਚੂ ਜੁਗਾਦਿ ਸਚੂ
                                                \testfeature{Script=Malayalam}{\malayalamtext}
                                                \testfeature{Script=Gurmukhi}{\gurmukhitext}
       தமிழ் தடேி தமிழ் தேடி
                                                \testfeature{Script=Tamil}{\tamiltext}
              רְדְתָּה רִבָּתה
                                                \testfeature{Script=Hebrew}{\hebrewtext}
                                                \def\examplefont{Doulos SIL}
           cấp số mỗi cấp số mỗi
                                                \testfeature{Language=Vietnamese}{\vietnamesetext}
```

Because these font features can change which features are able to be selected for the font, they are automatically selected by fontspec before all others and, if XaTeX is being used, will specifically select the OpenType renderer for this font, as described in Section 11.3 on page 40.

9.18.1 Script and Language examples

In the examples shown in Example 40, the Code2000 font 12 is used to typeset various input texts with and without the OpenType Script applied for various alphabets. The text is only rendered correctly in the second case; many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

9.18.2 Defining new scripts and languages

\newfontscript
\newfontlanguage

While the scripts and languages listed in Table 13 and Table 14 are intended to be comprehensive, there may be some missing; alternatively, you might wish to use different names to access scripts/languages that are already listed. Adding scripts and languages can be performed with the \newfontscript and \newfontlanguage commands. For example,

```
\newfontscript{Arabic}{arab}
\newfontlanguage{Zulu}{ZUL}
```

The first argument is the fontspec name, the second the OpenType tag. The advantage to using these commands rather than \newfontfeature (see Section 13 on page 45) is the error-checking that is performed when the script or language is requested.

^{12.} http://www.code2000.net/

Troisième partie

LuaT_EX-only font features

10 OpenType font feature files

An OpenType font feature file is a plain text file describing OpenType layout feature of a font in a human-readable format. The syntax of OpenType feature files is defined by $Adobe^{13}$.

Feature files can be used to add or customize OpenType features of a font on the fly without editing the font file itself.

Adding a new OpenType feature is as creating a plain text file defining the new feature and then loading it by passing its name or path to FeatureFile, then OpenType features defined in the file can be activated as usual.

For example, when adding one of the default features like kern or liga, no special activation is needed. On the other hand, an optional feature like onum or smcp will be activated when old style numbers or small capitals are activated, respectively. However, OpenType feature in the feature file can have any and that can be used to selectively activate the feature; for example defining a ligature feature called mlig and then activating it using RawFeature option without activating other ligatures in the font.

Figure 1 shows an example feature file. The first two lines set the script and language under which the defined features will be available, which the default language in both default and Latin scripts, respectively.

Then it defines a liga feature, which is a glyph substitution feature. The names starting with backslash are glyph names that is to be substituted and while the leading backslash is optional, it is used to escape glyph names when they interfere with preserved keywords. It should also be noted that glyph names are font specific and the same glyph can be named differently in different fonts.

    pos \A \Y -200;
    pos \a \y -80;
} kern;
```

Example 41: $X_{\overline{H}}T_{\overline{E}}X's$ Mapping feature.

Glyph positioning features like kerning can be defined in a similar way, but instead of the keyword sub(stitute) the keyword pos(ition) is used instead. Figure 1 shows an example of adding kerning between AY and ay 14 .

Lines starting with # are comments and will be ignored.

An OpenType feature file can have any number of features and can have a mix of substitution and positioning features, please refer to the full feature file specification for further documentation.

Quatrième partie Fonts and features with X_TT_EX

11 X₇T_FX-only font features

The features described here are available for any font selected by fontspec.

11.1 Mapping

Mapping enables a X=T=X text-mapping scheme, shown in Example 41. Using the tex-text mapping is also equivalent to writing Ligatures=TeX. The use of the latter syntax is recommended for better compatibility with LuaT=X documents.

^{14.} The kerning is expressed in font design units which are fractions of em depending on the *units per em* value of the font, usually 1000 for PostScript fonts and 2048 for TrueType fonts.

\fontspec{Didot}
\addfontfeature{LetterSpace=0.0}
USE TRACKING FOR DISPLAY CAPS TEXT \\
\addfontfeature{LetterSpace=2.0}
USE TRACKING FOR DISPLAY CAPS TEXT

USE TRACKING FOR DISPLAY CAPS TEXT USE TRACKING FOR DISPLAY CAPS TEXT

11.2 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the LetterSpace, which takes a numeric argument, shown in Example 42.

The letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a $10\,\mathrm{pt}$ font, a letter spacing parameter of '1.0' will add $0.1\,\mathrm{pt}$ between each letter.

This functionality *should not be used for lowercase text*, which is spacing correctly to begin with, but it can be very useful, in small amounts, when setting small caps or all caps titles. Also see the OpenType Uppercase option of the Letters feature (Section 9.2 on page 23).

11.3 Different font technologies : AAT and OpenType

X₂T₂X supports two rendering technologies for typesetting, selected with the Renderer font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, OpenType, is an open source OpenType interpreter. ¹⁵ It provides greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the OpenType renderer is used automatically, and for AAT fonts, AAT is chosen by default. Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, OpenType provides for the Script and Language features, which allow different font behaviour for different alphabets and languages; see Section 9.18 on page 35 for the description of these features. Because these font features can change which features are able to be selected for the font instance, they are selected by fontspec before all others and will automatically and without warning select the OpenType renderer.

11.4 Optical font sizes

Multiple Master fonts are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size (see ?? on page ?? for further details). Whereas an OpenType font will have only a few separate optical sizes, a Multiple Master font's optical size can be specified over a continuous range. Unfortunately, this flexibility makes it harder to create an automatic interface through LaTeX, and the optical size for a Multiple Master font must always be specified explicitly.

```
\fontspec{Minion MM Roman}[OpticalSize=11]
MM optical size test \\
```

^{15.} v2.4: This was called 'ICU' in previous versions of X \overline{A} TeX and fontspec. Backwards compatibility is preserved.

```
\fontspec{Minion MM Roman}[OpticalSize=47]
MM optical size test
\fontspec{Minion MM Roman}[OpticalSize=71]
MM optical size test
\\
```

12 Mac OS X's AAT fonts

Warning! $X \exists T \exists X'$ implementation on Mac OS X is currently in a state of flux and the information contained below may well be wrong from 2013 onwards. There is a good chance that the features described in this section will not be available any more as $X \exists T \exists X'$ completes its transition to a cross-platform—only application.

Mac OS X's font technology began life before the ubiquitous-OpenType era and revolved around the Apple-invented 'AAT' font format. This format had some advantages (and other disadvantages) but it never became widely popular in the font world.

Nonetheless, this is the font format that was first supported by XgTeX (due to its pedigree on Mac OS X in the first place) and was the first font format supported by fontspec. A number of fonts distributed with Mac OS X are still in the AAT format, such as 'Skia'.

12.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

Some other Apple AAT fonts have those 'Rare' ligatures contained in the Icelandic feature. Notice also that the old TEX trick of splitting up a ligature with an empty brace pair does not work in XETEX; you must use a 0 pt kern or \hbox (e.g., \null) to split the characters up if you do not want a ligature to be performed (the usual examples for when this might be desired are words like 'shelffull').

12.2 Letters

The Letters feature specifies how the letters in the current font will look. For AAT fonts, you may choose from Normal, Uppercase, Lowercase, SmallCaps, and InitialCaps.

12.3 Numbers

The Numbers feature defines how numbers will look in the selected font. For AAT fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced (the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in Section 6.3 on page 15.

12.4 Contextuals

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here. The options for AAT fonts are WordInitial, WordFinal (Example 43), LineInitial, LineFinal, and Inner (Example 44, also called 'non-final' sometimes). As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

Example 43: Contextual glyph for the beginnings and ends of words.

[Contextuals=WordInitial, WordFinal] where is all the vegenite

\newfontface\fancy{Hoefler Text Italic}
 [Contextuals={WordInitial,WordFinal}]
\fancy where is all the vegemite

Example 44: A contextual feature for the 'long s' can be convenient as the character does not need to be marked up explicitly.

'Inner' fwashes can <i>sometimes</i> contain the archaic long s.	\fontspec{Hoefler Text}[Contextuals=Inner]		
	`Inner' swashes can \emph{sometimes} \\		
	contain the archaic long [*] s.		

12.5 Vertical position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option is (supposed to be) contextually sensitive to only raise characters that appear directly after a number. These are shown in Example 45.

The realscripts package (also loaded by xltxtra) redefines the \textsubscript and \textsuperscript commands to use the above font features, including for use in footnote labels.

12.6 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in fontspec with the Fractions feature, which may be turned On or Off in both AAT and OpenType fonts.

In AAT fonts, the 'fraction slash' or solidus character, is to be used to create fractions. When Fractions are turned 0n, then only pre-drawn fractions will be used. See Example 46.

Using the Diagonal option (AAT only), the font will attempt to create the fraction from superscript and subscript characters.

Some (Asian fonts predominantly) also provide for the Alternate feature shown in Example 47.

Example 45: Vertical position for AAT fonts.

\[
\begin{array}{c} \fontspec{Skia} \\ \normal \\ \fontspec{Skia}[\text{VerticalPosition=Superior}] \\ \normal \\ \fontspec{Skia}[\text{VerticalPosition=Inferior}] \\ \normal \\ \normal

Example 47: Alternate design of pre-composed fractions.

12.7 Variants

The Variant feature takes a single numerical input for choosing different alphabetic shapes. Don't mind my fancy Example $48\,:$) I'm just looping through the nine (!) variants of Zapfino.

See Section 13 on page 45 for a way to assign names to variants, which should be done on a per-font basis.

12.8 Alternates

Selection of Alternates *again* must be done numerically; see Example 49. See Section 13 on page 45 for a way to assign names to alternates, which should be done on a per-font basis.

Example 48: Nine variants of Zapfino.

\newcounter{var}
\whiledo{\value{var}<9}{%
 \edef\1{%
 \noexpand\fontspec[Variant=\thevar,
 Color=0099\thevar\thevar]{Zapfino}}\1%
 \makebox[0.75\width]{d}%
 \stepcounter{var}}
\hspace*{2cm}</pre>

Example 49: Alternate shape selection must be numerical.

共産主義者

\fontspec{Hiragino Mincho Pro}
\verttext

\fontspec{Hiragino Mincho Pro}[Renderer=AAT,Vertical=RotatedGlyphs] \rotatebox{-90}{\verttext}% requires the graphicx package

12.9 Style

The options of the Style feature are defined in AAT as one of the following: Display, Engraved, IlluminatedCaps, Italic, Ruby, 16 TallCaps, or TitlingCaps.

Typical examples for these features are shown in Section 9.10.

12.10 CJK shape

There have been many standards for how CJK ideographic glyphs are 'supposed' to look. Some fonts will contain many alternate glyphs in order to be able to display these gylphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

12.11 Character width

See Section 9.16 on page 34 for relevant examples; the features are the same between OpenType and AAT fonts. AAT also allows CharacterWidth=Default to return to the original font settings.

12.12 Vertical typesetting

TODO: improve!

 $X_{\exists}T_{\exists}X$ provides for vertical typesetting simply with the ability to rotate the individual glyphs as a font is used for typesetting, as shown in Example 50.

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the X¬TEX documentation.

^{16. &#}x27;Ruby' refers to a small optical size, used in Japanese typography for annotations.

This is XeȚeX by Jonathan Kew.

\newAATfeature{Alternate}{HoeflerSwash}{17}{1}
\fontspec{Hoefler Text Italic}[Alternate=HoeflerSwash]
This is XeTeX by Jonathan Kew.

12.13 Diacritics

Diacritics are marks, such as the acute accent or the tilde, applied to letters; they usually indicate a change in pronunciation. In Arabic scripts, diacritics are used to indicate vowels. You may either choose to Show, Hide or Decompose them in AAT fonts. The Hide option is for scripts such as Arabic which may be displayed either with or without vowel markings. E.g., \fontspec[Diacritics=Hide]{...}

Some older fonts distributed with Mac OS X included '0/' etc. as shorthand for writing 'Ø' under the label of the Diacritics feature. If you come across such fonts, you'll want to turn this feature off (imagine typing hello/goodbye and getting 'helløgoodbye' instead!) by decomposing the two characters in the diacritic into the ones you actually want. I recommend using the proper LaTeX input conventions for obtaining such characters instead.

12.14 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature with the following options: Off, Box, RoundedBox, Circle, BlackCircle, Parenthesis, Period, RomanNumerals, Diamond, BlackSquare, BlackRoundSquare, and DoubleCircle.

Cinquième partie

Programming interface

This is the beginning of some work to provide some hooks that use fontspec for various macro programming purposes.

13 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I've left something out, so please let me know.

New AAT features may be created with this command:

Use the XaTeX file AAT-info. tex to obtain the code numbers. See Example 51.

New OpenType features may be created with this command :

 $\label{eq:local_local_problem} $$\operatorname{desture}(\operatorname{desture}) {(\operatorname{option})} {(\operatorname{desture} tag)}$$

The synonym \newICUfeature is deprecated.

Here's what it would look like in practise:

\newopentypefeature{Style}{NoLocalForms}{-locl}

\newAATfeature

\newopentypefeature

Example 52: Assigning new arbitary features.

sockdolager rubdown sockdolager rubdown

\newfontfeature{AvoidD}{Special=Avoid d-collisions}
\newfontfeature{NoAvoidD}{Special=!Avoid d-collisions}
\fontspec{Zapfino}[AvoidD,Variant=1]

sockdolager rubdown \\
\fontspec{Zapfino}[NoAvoidD, Variant=1]

sockdolager rubdown

Example 53: Using raw font features directly.

 $\label{eq:continuous} $$ \operatorname{Pagella small caps} $$ Pagella small caps $$ $$ \operatorname{Pagella small caps} $$$

\newfontfeature

In case the above commands do not accommodate the desired font feature (perhaps a new XqTeX feature that fontspec hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

 $\label{lem:lemma$

For example, Zapfino contains the feature 'Avoid d-collisions'. To access it with this package, you could do some like that shown in Example 52. (For some reason this feature doesn't appear to be working although fontspec is doing the right thing. To be investigated.)

The advantage to using the \newAATfeature and \newopentypefeature commands instead of \newfontfeature is that they check if the selected font actually contains the desired font feature at load time. By contrast, \newfontfeature will not give a warning for improper input.

14 Going behind fontspec's back

Expert users may wish not to use fontspec's feature handling at all, while still taking advantage of its Later font selection conveniences. The RawFeature font feature allows literal XaTeX font feature selection when you happen to have the OpenType feature tag memorised.

 $\label{prop:multiple} \mbox{Multiple features can either be included in a single declaration}:$

[RawFeature=+smcp;+onum]

or with multiple declarations:

[RawFeature=+smcp, RawFeature=+onum]

15 Renaming existing features & options

\aliasfontfeature

If you don't like the name of a particular font feature, it may be aliased to another with the \aliasfontfeature{ $\langle existing \ name \rangle$ } $\langle new \ name \rangle$ } command, such as shown in Example 54.

Spaces in feature (and option names, see below) *are* allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

 $\verb|\alias| font feature option|$

If you wish to change the name of a font feature option, it can be aliased to another with the command $\aliasfontfeatureoption{ <math>font feature \\ font featu$

Example 54	: Renaming font features.
Roman Letters And Swash	\aliasfontfeature{ItalicFeatures}{IF} \fontspec{Hoefler Text}[IF = {Alternate=1}] Roman Letters \itshape And Swash
Example 55: R	enaming font feature options.

\aliasfontfeature{VerticalPosition}{Vert Pos}
\aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci Inf}
\fontspec{LinLibertine_R.otf}[Vert Pos=Sci Inf]

Scientific Inferior: 12345

Scientific Inferior: 12345

This example demonstrates an important point: when aliasing the feature options, the *original* feature name must be used when declaring to which feature the option belongs.

Only feature options that exist as sets of fixed strings may be altered in this way. That is, Proportional can be aliased to Prop in the Letters feature, but 550099BB cannot be substituted for Purple in a Color specification. For this type of thing, the <text> newfontfeature command should be used to declare a new, e.g., PurpleColor feature:

\newfontfeature{PurpleColor}{color=550099BB}

Except that this example was written before support for named colours was implemented. But you get the idea.

16 Programming details

In some cases, it is useful to know what the \LaTeX font family of a specific fontspec font is. After a \fontspec-like command, this is stored inside the \l_fontspec_family_tl macro. Otherwise, \LaTeX sown \f@family macro can be useful here, too. The raw TEX font that is defined is stored temporarily in \l_fontspec_font.

The following commands in expl3 syntax may be used for writing code that interfaces with fontspec-loaded fonts. All of the following conditionals also exist with T and F as well as TF suffixes.

\fontspec_if_fontspec_font:TF Test whether the currently selected font has been loaded by fontspec.
\fontspec_if_aat_feature:nnTF Test whether the currently selected font contains the AAT feature (#1,#2).
\fontspec_if_opentype:TF Test whether the currently selected font is an OpenType font. Always true for LuaTeX fonts.
\fontspec_if_feature:nTF Test whether the currently selected font contains the raw OpenType feature #1. E.g.:
\fontspec_if_feature:nTF {pnum} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_feature:nnnTF Test whether the currently selected font with raw OpenType script tag #1 and raw OpenType

language tag #2 contains the raw OpenType feature tag #3. E.g.:\fontspec_if_feature:nTF {latn} {ROM} {pnum} {Tr Returns false if the font is not loaded by fontspec or is not an OpenType font. \fontspec_if_script:nTF

Test whether the currently selected font contains the raw OpenType script #1. E.g.: \fontspec_if_script:nTF {latn} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.

\fontspec_if_language:nTF

Test whether the currently selected font contains the raw OpenType language tag #1. E.g.: \fontspec_if_language:nTF {ROM} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.

\fontspec_if_language:nnTF

Test whether the currently selected font contains the raw OpenType language tag #2 in script #1. E.g.: \fontspec_if_language:nnTF {cyrl} {SRB} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.

fontspec_if_current_script:nTF

Test whether the currently loaded font is using the specified raw OpenType script tag #1.

ntspec_if_current_language:nTF

Test whether the currently loaded font is using the specified raw OpenType language tag #1.

\fontspec_set_family:Nnn

#1 : LATEX family #2 : fontspec features

#3 : font name

Defines a new NFSS family from given $\langle \textit{features} \rangle$ and $\langle \textit{font} \rangle$, and stores the family name in the variable $\langle \textit{family} \rangle$. This font family can then be selected with standard LaTeX commands \fontfamily{\lambda family}\selectfont. See the standard fontspec user commands for applications of this function.

\fontspec_set_fontface:NNnn

#1: primitive font #2: LATEX family #3: fontspec features #4: font name

Variant of the above in which the primitive TEX font command is stored in the variable \(\primitive font \rangle \). If a family is loaded (with bold and italic shapes) the primitive font command will only select the regular face. This feature is designed for LaTEX programmers who need to perform subsequent font-related tests on the \(\primitive font \rangle \).

Sixième partie

The patching/improvement of $\text{ET}_{E}X 2_{\varepsilon}$ and other packages

Derived originally from xltxtra, this package contains patches to various LATEX components and third-party packages to improve the default behaviour.

17 Inner emphasis

fixltx2e's method for checking for "inner" emphasis is a little fragile in $X = T_E X$, because font slant information might be missing from the font. Therefore, we use $E^T E^T X$'s NFSS information, which is more likely to be correct.

18 Unicode footnote symbols

By default LATEX defines symbolic footnote characters in terms of commands that don't resolve well; better results can be achieved by using specific Unicode characters or proper LICRs with the xunicode package.

This problem is solved by defining \@fnsymbol in a similar manner to the fixltx2e package.

19 Verbatim

Many verbatim mechanisms assume the existence of a 'visible space' character that exists in the ASCII space slot of the typewriter font. This character is known in Unicode as [U+0977]box open, which looks like this: ' $_{-}$ '.

When a Unicode typewriter font is used, LaTeX no longer prints visible spaces for the verbatim* environment and \verb* command. This problem is fixed by using the correct Unicode glyph, and the following packages are patched to do the same: listings, fancyvrb, moreverb, and verbatim.

In the case that the typewriter font does not contain $' _'$, the Latin Modern Mono font is used as a fallback.

20 Discretionary hyphenation: \-

LATEX defines the macro \- to insert discretionary hyphenation points. However, it is hard-coded in LATEX to use the hyphen - character. Since fontspec makes it easy to change the hyphenation character on a per font basis, it would be nice if \- adjusted automatically — and now it does.

21 Commands for old-style and lining numbers

\oldstylenums
\liningnums

LaTeX's definition of \oldstylenums relies on strange font encodings. We provide a fontspec-compatible alternative and while we're at it also throw in the reverse option as well. Use \oldstylenums{ $\langle text \rangle$ } to explicitly use old-style (or lowercase) numbers in $\langle text \rangle$, and the reverse for \liningnums{ $\langle text \rangle$ }.

Septième partie

fontspec.sty and friends

Herein lie the implementation details of this package. Welcome! It was my first.

22 'Header' code

We will eventually load the correct version of the code according to which engine we're running. As we'll see later, there are some minor differences between what we have to do in XALTEX and LuaLTEX.

```
The expl3 module is fontspec.
```

```
1 (@@=fontspec)
2 (*fontspec&!xetexx&!luatex)
```

But for now, this is the shared code.

```
3 \RequirePackage{expl3}[2015/06/26]
4 \RequirePackage{xparse}
5 \ExplSyntaxOn
   Quick fix for lualatex-math:
6 \cs_if_exist:NF \lua_now_x:n
7 { \cs_set_eq:NN \lua_now_x:n \directlua }
```

Check engine and load specific modules. For LuaTeX, load only luaotfload which loads luatexbase and lualibs too.

```
8\msg_new:nnn {fontspec} {cannot-use-pdftex}
9 {
10 The fontspec package requires either XeTeX or LuaTeX to function.
12 You must change your typesetting engine to,
   e.g., "xelatex" or "lualatex" \\
   instead of plain "latex" or "pdflatex".
15 }
16 \xetex_if_engine:F
17 {
   \luatex_if_engine:TF
19
20
     \RequirePackage{luaotfload}[2013/05/20]
21
    \directlua{require("fontspec")}
22
23
24
     \msg_fatal:nn {fontspec} {cannot-use-pdftex}
25
26 }
```

22.1 expl3 tools

22.2 Bits and pieces

Conditionals

firsttime As \keys_set:nn is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occuring per-shape this no longer needs to happen; this is indicated by the 'firsttime' conditional (initialised true).

```
27\bool_new:N \l_@@_firsttime_bool
                           28 \bool_new:N \l_@@_nobf_bool
                           29 \bool_new:N \l_@@_noit_bool
                           30 \bool_new:N \l_@@_nosc_bool
                           31 \bool_new:N \l_@@_tfm_bool
                           32\bool_new:N \l_@@_atsui_bool
                           33 \bool_new:N \l_@@_ot_bool
                           34 \bool_new:N \l_@@_mm_bool
                           35\bool_new:N \l_@@_graphite_bool
                          For dealing with legacy maths
                           36\bool_new:N \g_@@_math_euler_bool
                           37\bool_new:N \g_@@_math_lucida_bool
                           38 \bool_new:N \g_@@_pkg_euler_loaded_bool
                          For package options:
                           39 \bool_new:N \g_@@_cfg_bool
                           40 \bool_new:N \g_@@_math_bool
                          Counters
                           41 \int_new:N \l_fontspec_script_int
                           42 \int_new:N \l_fontspec_language_int
                           43 \int_new:N \l_fontspec_strnum_int
                          Other variables
                           44 \fp_new:N \l_@@_tmpa_fp
                           45 \fp_new:N \l_@@_tmpb_fp

```

22.5 Packages

New for LuaTeX, we load a new package called 'fontspec-patches' designed to incorporate the hidden but useful parts of the old xltxtra package.

```
259 \RequirePackage{fontspec-patches}
260 \luatex_if_engine:T { \RequirePackage{fontspec-luatex} \endinput }
261 \xetex_if_engine:T { \RequirePackage{fontspec-xetex} \endinput }
262 \langle /fontspec&!xetexx&!luatex \rangle
```

23 The main package code

That was the driver, and now the fun starts.

```
263 \langle *fontspec & (xetexx | Iuatex) \rangle
264 \langle ExplSyntaxOn
```

23.1 Encodings

Frank Mittelbach has recommended using the 'EUx' family of font encodings to experiment with Unicode. Now that $X_{\overline{1}}T_{\overline{2}}X$ can find fonts in the texmf tree, the Latin Modern OpenType fonts can be used as the defaults. See the euenc collection of files for how this is implemented.

```
265 (xetexx)\tl_set:Nn \g_fontspec_encoding_tl {EU1}
266 (luatex)\tl_set:Nn \g_fontspec_encoding_tl {EU2}
267 \tl_set:Nn \rmdefault {lmr}
268 \tl_set:Nn \sfdefault {lmss}
269 \tl_set:Nn \ttdefault {lmtt}
270 \RequirePackage[\g_fontspec_encoding_tl]{fontenc}
271 \t1_set_eq:NN \t1_set_eq
Dealing with a couple of the problems introduced by babel:
272 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
273 \tl_set_eq:NN \latinencoding
                                                                                                                                                \g_fontspec_encoding_tl
274 \AtBeginDocument
276 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
277 \tl_set_eq:NN \latinencoding
                                                                                                                                                  \g_fontspec_encoding_tl
278 }
```

That latin encoding definition is repeated to suppress font warnings. Something to do with \select@language ending up in the .aux file which is read at the beginning of the document.

xunicode Now we load xunicode, working around its internal X¬TEX check when under LuaTEX.

```

```

23.2 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the 'top level' definitions of the commands are contained herein; they all use or define macros which are defined or used later on in Section 23.5 on page 69.

23.2.1 Helper macros for argument mangling

```
286 \cs_new:Nn \@@_pass_args:nnn
287 {
288 \IfNoValueTF {#2}
    { \@@_post_arg:w {#1} {#3} }
289
   { #1 {#2} {#3} }
290
291 }
292 \NewDocumentCommand \@@_post_arg:w { m m O{} }
293 { #1 {#3} {#2} }
```

23.2.2 Font selection

\fontspec

This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font. Then this new font family is selected.

```
294 \NewDocumentCommand \fontspec { o m }
295 { \@@_pass_args:nnn \@@_fontspec:nn {#1} {#2} }
297 \cs_new:Nn \@@_fontspec:nn
298 {
299
    \fontencoding {\g_fontspec_encoding_tl}
300 \fontspec_set_family:Nnn \f@family {#1}{#2}
301 \selectfont
302 \ignorespaces
303 }
```

\setsansfont \setmonofont

\setmainfont The following three macros perform equivalent operations setting the default font for a particular family: 'roman', sans serif, or typewriter (monospaced). I end them with \normalfont so that if they're used in the document, the change registers immediately.

```
304 \DeclareDocumentCommand \setmainfont { o m }
305 { \@@_pass_args:nnn \@@_setmainfont:nn {#1} {#2} }
306
307 \cs_new:Nn \@@_setmainfont:nn
308 {
    \fontspec_set_family:Nnn \rmdefault {#1}{#2}
    \normalfont
   \ignorespaces
312 }
314 \DeclareDocumentCommand \setsansfont { o m }
315 { \@@_pass_args:nnn \@@_setsansfont:nn {#1} {#2} }
316
317 \cs_new:Nn \@@_setsansfont:nn
318 {
    \fontspec_set_family:Nnn \sfdefault {#1}{#2}
   \normalfont
```

```
321 \ignorespaces
                322 }
                324 \DeclareDocumentCommand \setmonofont { o m }
                325 { \@@_pass_args:nnn \@@_setmonofont:nn {#1} {#2} }
                327 \cs_new:Nn \@@_setmonofont:nn
                328 {
                329
                    \fontspec_set_family:Nnn \ttdefault {#1}{#2}
                330 \normalfont
                331 \ignorespaces
                332 }
 \setromanfont This is the old name for \setmainfont, retained for backwards compatibility.
                333 \cs_set_eq:NN \setromanfont \setmainfont
    \setmathrm These commands are analogous to \setmainfont and others, but for selecting the font used
    \setmathsf for \mathrm, etc. They can only be used in the preamble of the document. \setboldmathrm is
\setboldmathrm used for specifying which fonts should be used in \boldmath.
    \setmathtt
                334 \tl_new:N \g_@@_mathrm_tl
                335 \tl_new:N \g_@@_bfmathrm_tl
                336 \tl_new:N \g_@@_mathsf_tl
                337 \tl_new:N \g_@@_mathtt_tl
                338 \DeclareDocumentCommand \setmathrm { o m }
                339 { \@@_pass_args:nnn \@@_setmathrm:nn {#1} {#2} }
                341 \cs_new:Nn \@@_setmathrm:nn
                    \fontspec_set_family:Nnn \g_@@_mathrm_tl {#1} {#2}
                344 }
                345
                346 \DeclareDocumentCommand \setboldmathrm { o m }
                347 { \@@_pass_args:nnn \@@_setboldmathrm:nn {#1} {#2} }
                348
                349 \cs_new:Nn \@@_setboldmathrm:nn
                350 {
                351 \rightarrow \text{fontspec\_set\_family:Nnn } g_@e_bfmathrm_tl {#1} {#2}
                352 }
                354 \DeclareDocumentCommand \setmathsf { o m }
                355 { \@@_pass_args:nnn \@@_setmathsf:nn {#1} {#2} }
                356
                357 \cs_new:Nn \@@_setmathsf:nn
                    \fontspec_set_family:Nnn \g_@@_mathsf_tl {#1} {#2}
                360 }
                362 \DeclareDocumentCommand \setmathtt { o m }
                363 { \@@_pass_args:nnn \@@_setmathtt:nn {#1} {#2} }
                365 \cs_new:Nn \@@_setmathtt:nn
```

366 {

```
367 \fontspec_set_family:Nnn \g_@@_mathtt_tl {#1} {#2}
368 }
369 \@onlypreamble\setmathrm
370 \@onlypreamble\setmathrm
371 \@onlypreamble\setmathsf
372 \@onlypreamble\setmathtt

If the commands above are not executed, then \rmdefault (etc.) will be used.
373 \tl_set:Nn \g_@@_mathrm_tl {\rmdefault}
374 \tl_set:Nn \g_@@_mathsf_tl {\sfdefault}
375 \tl_set:Nn \g_@@_mathtt_tl {\ttdefault}
```

\newfontfamily
\newfontface

This macro takes the arguments of \fontspec with a prepended $\langle instance\ cmd \rangle$. This command is used when a specific font instance needs to be referred to repetitively (e.g., in a section heading) since continuously calling \fontspec_select:nn is inefficient because it must parse the option arguments every time.

\fontspec_select:nn defines a font family and saves its name in \l_fontspec_family_tl. This family is then used in a typical NFSS \fontfamily declaration, saved in the macro name specified.

```
376 \DeclareDocumentCommand \newfontfamily { m o m }
377 { \@@_pass_args:nnn { \@@_newfontfamily:Nnn #1 } {#2} {#3} }
379 \cs_new:Nn \@@_newfontfamily:Nnn
    \fontspec_set_family:cnn { g_@@_ \cs_to_str:N #1 _family } {#2} {#3}
381
382
383
384
       \exp_not:N \DeclareRobustCommand \exp_not:N #1
385
386
         \exp_not:N \fontencoding {\g_fontspec_encoding_tl}
387
        \exp_not:N \fontfamily { \use:c {g_@@_ \cs_to_str:N #1 _family} } \exp_not:N \selectfont
388
        }
389
390 }
\newfontface uses the fact that if the argument to BoldFont, etc., is empty (i.e., BoldFont={}),
then no bold font is searched for.
391 \DeclareDocumentCommand \newfontface { m o m }
392 { \@@_pass_args:nnn { \@@_newfontface:Nnn #1 } {#2} {#3} }
393
```

23.2.3 Font feature selection

397 }

394 \cs_new:Nn \@@_newfontface:Nnn

\defaultfontfeatures

This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent \fontspec, et al., commands. It stores its value in \g_fontspec_default_fontopts_tl (initialised empty), which is concatenated with the individual macro choices in the [...] macro.

\newfontfamily #1 [BoldFont={},ItalicFont={},SmallCapsFont={},#2] {#3}

```
398\clist_new:N \g_@@_default_fontopts_clist
399\prop_new:N \g_@@_fontopts_prop
```

```
400 \DeclareDocumentCommand \defaultfontfeatures { t+ o m }
401 {
402
    \IfNoValueTF {#2}
403
     { \@@_set_default_features:nn {#1} {#3} }
     { \@@_set_font_default_features:nnn {#1} {#2} {#3} }
    \ignorespaces
407 \cs_new:Nn \@@_set_default_features:nn
408 {
    \IfBooleanTF {#1} \clist_put_right:Nn \clist_set:Nn
     \g @\_default\_fontopts\_clist \ \{\#2\}
410
411 }
```

The optional argument specifies a font identifier. Branch for either (a) single token input such as \rmdefault, or (b) otherwise assume its a fontname. In that case, strip spaces and file extensions and lower-case to ensure consistency.

```
412 \cs_new:Nn \@@_set_font_default_features:nnn
413 {
   \clist_map_inline:nn {#2}
414
415
     \tl_if_single:nTF {##1}
416
     { \tl_set:No \l_@@_tmp_tl { \cs:w g_@@_ \cs_to_str:N ##1 _family\cs_end: } }
417
418
      { \@@_sanitise_fontname: Nn \l_@@_tmp_tl {##1} }
419
420
     \IfBooleanTF {#1}
421
       423
        { \tl_clear:N \l_@@_tmpb_tl }
       \tl_put_right:Nn \l_@@_tmpb_tl {#3,}
424
       425
426
427
428
       \tl_if_empty:nTF {#3}
429
        { \prop_gremove:NV \g_@@_fontopts_prop \l_@@_tmp_tl }
        { \prop_put:NVn \ \g_@e_fontopts_prop \l_@e_tmp_tl \{#3,} }
430
431
      }
432
    }
433 }
```

\@@_sanitise_fontname:Nn Assigns font name #2 to token list variable #1 and strips extension(s) from it in the case of an external font. We strip spaces for luatex for consistency with luaotfload, although I'm not sure this is necessary any more. At one stage this also lowercased the name, but this step has been removed unless someone can remind me why it was necessary.

```
434 \cs_new:Nn \@@_sanitise_fontname:Nn
435 {
436 \tl_set:Nx #1 {#2}
437 (luatex) \tl_remove_all:Nn #1 {~}
    \clist_map_inline:Nn \l_@@_extensions_clist
439
     { \tl_remove_once:Nn #1 {##1} }
440 }
```

\addfontfeatures

In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level \fontspec command.

The default options are *not* applied (which is why $\g_fontspec_default_fontopts_tl$ is emptied inside the group; this is allowed as $\l_fontspec_family_tl$ is globally defined in $\fontspec_select:nn$), so this means that the only added features to the font are strictly those specified by this command.

\addfontfeature is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```
441 \bool_new:N \l_@@_disable_defaults_bool
442 \DeclareDocumentCommand \addfontfeatures {m}
443 {
444
   \fontspec_if_fontspec_font:TF
445
    {
446
     \group_begin:
       447
448
       \bool_set_true:N \l_@@_disable_defaults_bool
449
       \use:x
450
451
       {
452
         \exp_not:N \fontspec_select:nn
453
          { \l_@@_options_tl , #1 } {\l_@@_fontname_tl}
454
455
     \group_end:
     \fontfamily\l_fontspec_family_tl\selectfont
456
457
458
     \@@_warning:n {addfontfeatures-ignored}
459
460
   \ignorespaces
461
463 \cs_set_eq:NN \addfontfeature \addfontfeatures
```

23.2.4 Defining new font features

\newfontfeature

\newfontfeature takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

\newAATfeature

This command assigns a new AAT feature by its code (#2,#3) to a new name (#1). Better than \newfontfeature because it checks if the feature exists in the font it's being used for.

```
474 \DeclareDocumentCommand \newAATfeature {mmmm}
                         476
                              \keys_if_exist:nnF { fontspec } {#1}
                         477
                                { \@@_define_font_feature:n {#1} }
                              \keys_if_choice_exist:nnnT {fontspec} {#1} {#2}
                                { \@@_warning:nxx {feature-option-overwrite} {#1} {#2} }
                         480
                              481 }
    \newopentypefeature
                         This command assigns a new OpenType feature by its abbreviation (#2) to a new name (#1).
         \newICUfeature
                         Better than \newfontfeature because it checks if the feature exists in the font it's being used
                         482 \DeclareDocumentCommand \newopentypefeature {mmm}
                         483 {
                         484
                              \keys_if_exist:nnF { fontspec / options } {#1}
                         485
                                { \@@_define_font_feature:n {#1} }
                              \keys_if_choice_exist:nnnT {fontspec} {#1} {#2}
                                { \@@_warning:nxx {feature-option-overwrite} {#1} {#2} }
                         487
                              \@@_define_feature_option:nnnnn {#1}{#2}{}{}{#3}
                         488
                         489 }

\newfontlanguage

Mostly used internally, but also possibly useful for users, to define new OpenType 'languages', mapping logical names to OpenType language tags. Iterates though the languages in the selected font to check that it's a valid feature choice, and then prepends the $(X_{\overline{4}}T_{\overline{2}}X)$ \font feature string with the appropriate language selection tag.

```
546 \DeclareDocumentCommand \newfontlanguage {mm}
547 {
    \fontspec_new_lang:nn {#1} {#2}

23.3 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via \fontspec or from a \newfontfamily macro or from \setmainfont and so on.)

```
Test whether the currently selected font has been loaded by fontspec.

23.5 Internal macros

The macros from here in are used internally by all those defined above. They are not designed to remain consistent between versions.

\fontspec_select:nn

This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l_fontspec_family_tl. The TFX '\font' command is (globally) stored in \l_fontspec_font.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about :

- \l_fontspec_fontname_tl is used as the generic name of the font being defined.
- \l_@@_fontid_tl is the unique identifier of the font with all its features.

```
— \l_fontspec_fontname_up_tl is the font specifically to be used as the upright font.
```

- \l_@@_basename_tl is the (immutable) original argument used for *-replacing.
- \l_fontspec_font is the plain TFX font of the upright font requested.

```

Check if the family is unique and, if so, save its information. (\addfontfeature and other macros use this data.) Then the font family and its shapes are defined in the NFSS.

Now we have a unique (in fact, too unique!) string that contains the family name and every option in abbreviated form. This is used with a counter to create a simple NFSS family name for the font we're selecting.

23.5.1 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if \bfdefault is redefined to b, all bold shapes defined by this package will also be assigned to b.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then set_autofont will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

1049
1050 }
1051 (/luatex)
```

\@@_set_autofont:Nnn #1 : Font name tl

- #2: Base font name
- #3: Font name modifier

This function looks for font with $\langle name \rangle$ and $\langle modifier \rangle$ #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like /B to look for a bold font, for example.

We can't match external fonts in this way (in X \exists T \exists X anyway; todo: test with LuaTeX). If $\langle font \ name \ tl \rangle$ is not empty, then it's already been specified by the user so abort. If $\langle Base \ font \ name \rangle$ is not given, we also abort for obvious reasons.

If $\langle font \ name \ tl \rangle$ is empty, then proceed. If not found, $\langle font \ name \ tl \rangle$ remains empty. Otherwise, we have a match.

                             \1_@@_nfss_tl defined above. \1_@@_postadjust_tl is defined in various places to deal
                             with things like the hyphenation character and interword spacing.
                                 The main part is to loop through SizeFeatures arguments, which are of the form
                                                  SizeFeatures={{<one>},{<two>},{<three>}}.

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the \@@_set_slanted: code will overwrite this anyway if necessary.

23.5.3 Features

language = \l_fontspec_lang_tl

\@@_get_features: Nn This macro is the original n

1247

1248 }
1249 }
1250 ⟨/luatex⟩

This macro is a wrapper for \keys_set:nn which expands and adds a default specification to the original passed options. It begins by initialising the commands used to hold font-feature specific strings. Its argument is any additional features to prepend to the default.

```

c_make_AAT_feature_string:nnTF

1421 }

This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 82).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is odd, it corresponds to switching the feature off. But $X_{\overline{A}}T_{\overline{E}}X$ doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to check the selector of the previous number, and then prefix the feature string with! to denote the switch.

Finally, save out the complete feature string in $\lower \$ in \1_fontspec_feature_string_tl. 1422 \prg_new_conditional: Nnn \fontspec_make_AAT_feature_string: nn \{TF,T,F}\] 1423 \{

\fontspec_iv_str_to_num:Nn
\fontspec_v_str_to_num:Nn

This macro takes a four character string and converts it to the numerical representation required for X π TeX OpenType script/language/feature purposes. The output is stored in \l_fontspec_strnum_int.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc', 'ab', 'ab', 'etc. (It is assumed the first two chars are <code>always</code> not spaces.) So this macro reads in the string, delimited by a space; this input is padded with \@emptys and anything beyond four chars is snipped. The \@emptys then are used to reconstruct the spaces in the string to number calculation.

The variant $fontspec_v_str_to_num$ in is used when looking at features, which are passed around with prepended plus and minus signs (e.g., +liga, -dlig); it simply strips off the first char of the input before calling the normal $fontspec_iv_str_to_num$ in.

```

```

23.6.3 Bold/italic choosing options

The Bold, Italic, and BoldItalic features are for defining explicitly the bold and italic fonts used in a font family.

Bold (NFSS) Series By default, fontspec uses the default bold series, \bfdefault. We want to be able to make this extensible.

```
1635 \seq_new:N \g_@@_bf_series_seq
1636 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSeries}
                    \tl_gset:Nx \g_@@_curr_series_tl { #1 }
1639 \seq_gput_right:Nx \g_@@_bf_series_seq { #1 }
1640 }
   Fonts Upright:
1641 \@@_keys_define_code:nnn {fontspec-preparse-external} {UprightFont}
1642 {
                  \fontspec_complete_fontname: Nn \l_fontspec_fontname_up_tl {#1}
1643
1644 }
1645 \@@_keys_define_code:nnn {fontspec-preparse-external} {FontName}

                       Scale If the input isn't one of the pre-defined string options, then it's gotta be numerical.
                       \fontspec_calc_scale:n does all the work in the auto-scaling cases.
                      1830 \@@_keys_define_code:nnn {fontspec} {Scale}
```

```
1831 {
1832
     \str_case:nnF {#1}
1833
       {MatchLowercase} { \@@_calc_scale:n {5} }
1834
1835
       {MatchUppercase} { \@@_calc_scale:n {8} }
1836
1837
      { \tl_set:Nx \l_@@_scale_tl {#1} }
    \tl_set:Nx \l_@@_scale_tl { s*[\l_@@_scale_tl] }
1839 }
```

\@@_calc_scale:n

This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in $X_{\Xi}T_{\Xi}X$).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```
1840 \cs_new:Nn \@@_calc_scale:n
1841 {
1842
      \group_begin:
1843
         \rmfamily
         \ensuremath{\mbox{\ensuremath{\mbox{\sc NnN $\l$_{\ensuremath{\mbox{\sc NnPa\_dim}$}}$}} \fi \font
1844
1845
         \@@_set_font_dimen:NnN \l_@@_tmpb_dim {#1} \l_fontspec_font
1846
         \tl_gset:Nx \l_@@_scale_tl
1847
          {
           \fp_eval:n { \dim_to_fp:n {\l_@@_tmpa_dim} /
1848
                           \dim_to_fp:n {\l_@@_tmpb_dim} }
1849
1850
1851
         \@@_info:n {set-scale}
      \group_end:
1852
1853 }
```

\@@_set_font_dimen:NnN

This function sets the dimension #1 (for font #3) to 'fontdimen' #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect 'zero' value (as \fontdimen8 might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an 'X' or an 'X'.

```
1854 \cs_new: Nn \@@_set_font_dimen: NnN
1855 {
      \dim_set:Nn #1 { \fontdimen #2 #3 }
1856
      \dim_compare:nNnT #1 = {0pt}
1857
1859
        \settoheight #1
          \str_if_eq:nnTF {#3} {\font} \rmfamily #3
1862
          \int_case:nnn #2
1863
1864
             {5} {x} % x-height
1865
             {8} {X} % cap-height
           } {?} % "else" clause; never reached.
1866
1867
1868
1869 }
```

Inter-word space These options set the relevant \fontdimens for the font being loaded.

```
1870 \@@_keys_define_code:nnn {fontspec} {WordSpace}
1871 {
1872 \bool_if:NF \l_@@_firsttime_bool
1873 { \_fontspec_parse_wordspace:w #1,,,\q_stop }
1874 }
```

_fontspec_parse_wordspace:w This macro determines if the input to WordSpace is of the form $\{X\}$ or $\{X,Y,Z\}$ and executes the font scaling. If the former input, it executes $\{X,X,X\}$.

23.6.6 Font transformations

These are to be specified to apply directly to a font shape:

```
2050 \keys_define:nn {fontspec}
2051 {
2052  FakeSlant .code:n =
2053  {
2054  \@@_update_featstr:n{slant=#1}
```

```
2055
2056
     FakeSlant .default:n = {0.2}
2057 }
2058 \keys_define:nn {fontspec}
2059 {
2060
     FakeStretch .code:n =
2061
2062
        \@@_update_featstr:n{extend=#1}
2063
2064
     FakeStretch .default:n = {1.2}
2065 }
2066 (*xetexx)
2067 \keys_define:nn {fontspec}
2069
     FakeBold .code:n =
2070
        \@@_update_featstr:n {embolden=#1}
2071
2072
      },
     FakeBold .default:n = {1.5}
2074 }
2075 \langle /xetexx \rangle
2076 (*luatex)
2077 \keys_define:nn {fontspec}
2079 FakeBold .code:n = { \@@_warning:n {fakebold-only-xetex} }
2080 }
2081 (/luatex)
```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create 'fake' shapes.

The behaviour is currently that only if both AutoFakeSlant *and* AutoFakeBold are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I'd like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```
2082 \keys_define:nn {fontspec}
2083 {
2084
     AutoFakeSlant .code:n =
2085
       \bool_if:NT \l_@@_firsttime_bool
2086

Turkish Turns out that many fonts use 'TUR' as their Turkish language tag rather than the specified 'TRK'. So we check for both:

```
2582 \keys_define:nn {fontspec}
2583 {
2584
     Language / Turkish .code:n =
2585
       \fontspec_check_lang:nTF {TRK}
2586
2587
2588
          \int_set:Nn \l_fontspec_language_int {\l_fontspec_strnum_int}
          \tl_set:Nn \l_fontspec_lang_tl {TRK}
2589
         }
2590
2591
          \fontspec_check_lang:nTF {TUR}
2594
            \int_set:Nn \l_fontspec_language_int {\l_fontspec_strnum_int}
2595
            \tl_set:Nn \l_fontspec_lang_tl {TUR}
2596
2597
2598
            \@@_warning:nx {language-not-exist} {Turkish}
2599
            \keys_set:nn {fontspec} {Language=Default}
```

Default

```
2604 \@@_keys_define_code:nnn {fontspec}{ Language / Default }
2606
    \tl_set:Nn \l_fontspec_lang_tl {DFLT}
2607 \int_zero:N \l_fontspec_language_int
2608 }
```

23.6.23 Raw feature string

This allows savvy X_HT_EX-ers to input font features manually if they have already memorised the OpenType abbreviations and don't mind not having error checking.

```
2609 \@@_keys_define_code:nnn {fontspec} {RawFeature}
2610 {
2611 \@@_update_featstr:n {#1}
2612 }
```

23.7 Italic small caps

The following code for utilising italic small caps sensibly is inspired from Philip Lehman's The Font Installation Guide. Note that \upshape needs to be used twice to get from italic small caps to regular upright (it always goes to small caps, then regular upright).

\textsi

\sishape First, the commands for actually selecting italic small caps are defined. I use si as the NFSS shape for italic small caps, but I have seen itsc and slsc also used. \sidefault may be redefined to one of these if required for compatibility.

```
2613 \providecommand*{\sidefault}{si}
2614 \DeclareRobustCommand{\sishape}
2615 {
2616 \not@math@alphabet\sishape\relax
2617 \fontshape\sidefault\selectfont
2619 \DeclareTextFontCommand{\textsi}{\sishape}
```

\fontspec_blend_shape:nnn This is the macro which enables the overload on the \.. shape commands. It takes three such arguments. In essence, the macro selects the first argument, unless the second argument is already selected, in which case it selects the third.

```
2620 \cs_new:Nn \fontspec_blend_shape:nnn
         2621 {
         2622 \bool_if:nTF
             {
         2624
                \str_if_eq_x_p:nn {\f@shape} {#2} &&
               \cs_if_exist_p:c {\f@encoding/\f@family/\f@series/#3}
               { \fontshape{#3}\selectfont }
         2627
               { \fontshape{#1}\selectfont }
         2628
         2629 }
\itshape Here the original \...shape commands are redefined to use the merge shape macro.
```

```

23.8 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever \setmainfont and friends was run.

\fontspec_setup_maths:

Everything here is performed \AtBeginDocument in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
2650 \@ifpackageloaded{euler}
2651 {
     \bool_set_true:N \g_@@_pkg_euler_loaded_bool
2654 {
     \bool_set_false:N \g_@@_pkg_euler_loaded_bool
2655
2656 }
2657 \cs_set:Nn \fontspec_setup_maths:
2658 {
2659
     \@ifpackageloaded{euler}
       \bool_if:NTF \g_@@_pkg_euler_loaded_bool
        { \bool_set_true:N \g_@@_math_euler_bool }
2663
        { \@@_error:n {euler-too-late} }
2664
      }
     \@ifpackageloaded{lucbmath}{\bool_set_true:N \g_@@_math_lucida_bool}{}
      \@ifpackageloaded{lucidabr}{\bool_set_true:N \g_@@_math_lucida_bool}{}
2667
     \@ifpackageloaded{lucimatx}{\bool_set_true:N \g_@@_math_lucida_bool}{}
```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, cmr, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in LaTeX's operators maths font to still go back to the legacy cmr font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a \hat accent in EulerFractur, but it's ugly. So I ignore it. Sorry if this causes inconvenience.)

```
\DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
2669
2670 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
2671 \DeclareMathAccent{\acute} {\mathalpha}{legacymaths}{19}
2672 \DeclareMathAccent{\grave}
                                  {\mathalpha}{legacymaths}{18}
2673 \DeclareMathAccent{\ddot}
                                  {\mathalpha}{legacymaths}{127}
2674 \DeclareMathAccent{\tilde}
                                 {\mathalpha}{legacymaths}{126}
2675 \DeclareMathAccent{\bar}
                                  {\mathalpha}{legacymaths}{22}
2676 \DeclareMathAccent{\breve}
                                  {\mathalpha}{legacymaths}{21}
2677
    \DeclareMathAccent{\check}
                                  {\mathalpha}{legacymaths}{20}
                                  {\mathalpha}{legacymaths}{94} % too bad, euler
2678 \DeclareMathAccent{\hat}
2679
     \DeclareMathAccent{\dot}
                                  {\mathalpha}{legacymaths}{95}
2680
    \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}
```

\colon: what's going on? Okay, so: and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```
% fontmath.ltx:
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{"3A}
\DeclareMathSymbol{:}{\mathrel}{operators}{"3A}

% amsmath.sty:
\renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
\mkern-\thinmuskip{:}\mskip6muplus1mu\relax}

% euler.sty:
\DeclareMathSymbol{:}\mathrel {EulerFraktur}{"3A}

% lucbmath.sty:
\DeclareMathSymbol{\@tempb}{\mathpunct}{operators}{58}
\ifx\colon\@tempb
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
\fi
\DeclareMathSymbol{:}{\mathrel}{operators}{58}
\fi
\DeclareMathSymbol{:}{\mathrel}{operators}{58}
\
```

 $(3A_16 = 58_10)$ So I think, based on this summary, that it is fair to tell fontspec to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```
2681 \group_begin:
2682 \mathchardef\@tempa="603A \relax
2683 \ifx\colon\@tempa
2684 \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
2685 \fi
2686 \group_end:
```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```
2687 \bool_if:NF \g_@@_math_euler_bool
2688 {
2689 \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
2690 \DeclareMathSymbol{:}{\mathrel} {legacymaths}{58}
```

```
2691 \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
2692 \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}
```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```
\bool_if:NF \g_@@_math_lucida_bool
2693

```

Finally, we change the font definitions for \mathrm and so on. These are defined using the $g_@_mathrm_tl(...)$ macros, which default to \rmdefault but may be specified with the \setmathrm(...) commands in the preamble.

Since LaTeX only generally defines one level of boldness, we omit \mathbf in the bold maths series. It can be specified as per usual with \setboldmathrm, which stores the appropriate family name in \g_@e_bfmathrm_tl.

```

 We're a little less sophisticated about not executing the maths setup if various other maths
 font packages are loaded. This list is based on the wonderful 'LATEXFont Catalogue': http:
 //www.tug.dk/FontCatalogue/mathfonts.html. I'm sure there are more I've missed. Do the
 TEX Gyre fonts have maths support yet?
    Untested:would\unless\ifnum\Gamma=28672\relax\bool_set_false:N\g_@@_math_bool\fi
be a better test? This needs more cooperation with euler and lucida, I think.

23.14 Verbatims

Many thanks to Apostolos Syropoulos for discovering this problem and writing the redefinion of LATEX's verbatim environment and \verb* command.

\fontspec_visible_space: Print [U+0982]Open box, which is used to visibly display a space character.

```
54\cs_new:Nn \fontspec_visible_space:
  \font_glyph_if_exist:NnTF \font {"2423}
   { \char"2423\scan_stop: }
    { \fontspec_visible_space_fallback: }
```

```
60 \cs_new:Nn \fontspec_visible_space_fallback:
61 {
     \usefont{\g_fontspec_encoding_tl}{lmtt}{\f@series}{\f@shape}
   \textvisiblespace
65
66 }
```

fontspec_print_visible_spaces:

Helper macro to turn spaces (^^20) active and print visible space instead.

```
67 \group_begin:
68 \char_set_catcode_active:n{"20}%
69 \cs_gset:Npn\fontspec_print_visible_spaces:{%
70 \char_set_catcode_active:n{"20}%
71 \cs_set_eq:NN^^20\fontspec_visible_space:%
72 }%
73 \group_end:
```

```
\verb Redefine \verb to use \fontspec_print_visible_spaces :.
   \verb*
           74 \def\verb
           75 {
           76 \relax\ifmmode\hbox\else\leavevmode\null\fi
                  \verb@eol@error \let\do\@makeother \dospecials
           78
                  \verbatim@font\@noligs
                  \@ifstar\@@sverb\@verb
           80
           81 }
            82 \def\@@sverb{\fontspec_print_visible_spaces:\@sverb}
               It's better to put small things into \AtBeginDocument, so here we go:
           83 \AtBeginDocument
               \fontspec_patch_verbatim:
               \fontspec_patch_moreverb:
               \fontspec_patch_fancyvrb:
           88
               \fontspec_patch_listings:
           89 }
verbatim* With the verbatim package.
           90 \cs_set:Npn \fontspec_patch_verbatim:
               \@ifpackageloaded{verbatim}
           92
           93
           94
                  \cs_set:cpn {verbatim*}
           95
                   \group_begin: \@verbatim \fontspec_print_visible_spaces: \verbatim@start
           96
           97
           98
           This is for vanilla LATEX.
           99
                  \cs_set:cpn {verbatim*}
           100
                    \@verbatim \fontspec_print_visible_spaces: \@sxverbatim
           104
           105 }
          This is for moreverb. The main listing* environment inherits this definition.
           106 \cs_set:Npn \fontspec_patch_moreverb:
           107 {
                \@ifpackageloaded{moreverb}{
           108
                  \cs_set:cpn {listingcont*}
           109
                    \cs_set:Npn \verbatim@processline
                      \thelisting@line \global\advance\listing@line\c_one
           114
                      \the\verbatim@line\par
           115
                    \@verbatim \fontspec_print_visible_spaces: \verbatim@start
           116
```

```
117
118 }{}
119 }
   listings and fancvrb make things nice and easy:
120 \cs_set:Npn \fontspec_patch_fancyvrb:
122 \@ifpackageloaded{fancyvrb}
      \cs_set_eq:NN \FancyVerbSpace \fontspec_visible_space:
124
125
126 }
127 \cs_set:Npn \fontspec_patch_listings:
129 \@ifpackageloaded{listings}
      \cs_set_eq:NN \lst@visiblespace \fontspec_visible_space:
133 }
```

23.15 \oldstylenums

\liningnums command.

\oldstylenums This command obviously needs a redefinition. And we may as well provide the reverse

```
134 \RenewDocumentCommand \oldstylenums {m}
135 {
136  { \addfontfeature{Numbers=OldStyle} #1 }
138 \NewDocumentCommand \liningnums {m}
140      { \addfontfeature{Numbers=Lining} #1 }
141 }
142\left</\mathsf{patches}\right>
```
